The general powers of notaries are not defined by statute, being derived from the civil law and the law merchant; and their official acts, attested by signature and official seal, are generally received in evidence in whatever country they are offered, while similar acts of commissioners and other purely statutory officers are generally receivable only in the jurisdiction for which the officer was appointed, unless specially authenticated by some judicial authority. In various jurisdictions some special powers have been conferred upon notaries besides those derived from the origin and nature of their office.—**Apostolical notary**, an official charged with despatching the orders of the papal see.—**Ecclesiastical notary**, in the early church, a clerk or secretary, especially a shorthand-writer, employed to record the proceedings of councils and tribunals, report sermons, take notes, and prepare papers for bishops and abbots.—**Notary public**. See def. 2, above.

**notary**<sup>2</sup>, **notaryet**, *a.* Corrupt forms of *notary*.

**Notaspidea** (nô'tas-pid'ē-ä), *n. pl.* [NL., *<* *Notaspis* + *-idea*.] A primary group of tectibranchiate gastropods, characterized by the development of either a large *notæum* or a true mantle, secreting a small external discoid shell. It includes the families *Pleurobranchidae*, *Runcinidae*, and *Umbraculidae*.

**notaspis** (nô'tas'pis), *n.* [NL., *<* Gr. *νόστος*, the back, + *ασπίς*, shield.] **1.** The first well-defined central dorsal area of the embryo. It is the outward appearance of the germ-disk or germinative heap of endoderm and mesoderm-cells within the blastodermic layer of cells of the ectoderm; at first circular, then elongated, oval, sole-shaped, slipper-shaped, canoe-shaped, etc.; and along its long axis soon appears the primitive furrow or primitive groove, in which the spinal column and spinal cord are to be laid down after this groove has turned into a tube. Also called *germ-shield*.

**2.** [cap.] In *entom.*: (a) Same as *Oribates*. (b) A genus of chalcid hymenopterous insects, founded by Walker in 1834. They have the abdomen almost sessile, middle tibiae spurred, ovipositor short, hind femora with a single large tooth, and the mesoscutellum large and acuminate. *N. formiciformis* of St. Vincent's Island, the only species known, is no doubt parasitic.

**notate** (nô'tät), *a.* [*<* L. *notatus*, pp. of *notare*, mark; see *note*<sup>1</sup>, *r.*] In *zool.* and *bot.*, marked with spots or lines; variegated.

**notation** (nô'tā'shon), *n.* [= F. *notation* = Sp. *notación* = Pg. *notação* = It. *notazione*, *<* L. *notatio* (n-), a marking, a designation, an observation, the designation of the meaning and derivation of a word, etymology, *<* *notare*, mark, designate; see *note*<sup>1</sup>, *r.* **1.** The act of noting, in any sense.—**2.** A system of written signs of things and relations (not of significant sounds or letters), used in place of language on account of its superior clearness and brevity. Notations are employed to advantage in every branch of mathematics, in logic, in astronomy, in chemistry, in music, in proof-reading, etc. (a) Two systems of arithmetical notation are now in use, the Roman and the Arabic. The Roman system is employed for numbering books and their parts, in monumental inscriptions, and in marking timber and other objects with the chisel. A large number in this system is written as follows: As many thousands as possible being taken from the number (without a negative remainder), an M is written for every thousand; five hundred is then taken, if possible, and D is written for it; as many hundreds as possible are next taken, and a C written for each; fifty is next taken, if possible, and L is written for it; as many tens as possible are next taken, and an X written for each; five is then taken, if possible, and V is written for it; and finally an I is written for every unit remaining. But usually instead of IIII is written IV; in place of VIIII, IX; in place of XXXX, XL; in place of LXXXX, XC, etc. Anciently, there were other extensions of this system. The Arabic notation consists in the use of the Arabic figures and decimal places. See *Arabic* and *decimal*. (b) In the algebraic notation employed in all branches of mathematical analysis all objects upon which the operations of addition, multiplication, etc., are performed are denoted by letters. These objects are generally quantities (and are so called in describing the notation), though they may be operations, as in the calculus of functions, etc., geometrical conditions, as in enumerative geometry, or propositions, as in the calculus of logic. It is usual to give certain letters certain significations (for which see the letters). Furthermore,  $\infty$  denotes infinite magnitude;  $\odot$ , the ratio of the circumference to the diameter, or 3.14159...;  $\phi$ , the Napierian base, or 2.71828...;  $\perp$ , a right angle, etc. The sign = placed between two quantities states their equality: as, sp. gr. mercury = 13.5. In like manner,  $>$  means 'is greater than,'  $<$  'is less than,'  $\leq$  'is as small as,'  $\geq$  'is as great as,'  $\neq$  'is smaller than or equal to,'  $\equiv$  'is greater than or equal to,'  $\neq$  'is not equal to,'  $\leq$  'is not smaller than,'  $\geq$  'is not greater than,'  $\sim$  'is proportional to,'  $\cong$  'is congruent to,' in the theory of numbers. The last sign is also used to mean 'is identically equal to,' thus stating two relations, one mathematical, the other logical. The sum of two quantities is denoted by writing them with the sign +, called *plus*, between them: as,  $3 + 2 = 5$ . The difference of two quantities is denoted by writing first the minuend, then the sign -, called *minus*, then the subtrahend: as,  $5 - 3 = 2$ . When + or - occurs with no quantity before it, 0 is to be supplied: thus,  $3 - 5 = -2$  means that 5 less than 3 is 2 below zero. But when a value has + or - after it and no quantity following, what is meant is that

something further is to be added or subtracted. The sign  $\pm$ , called *plus* or *minus*, is ordinarily used in a disjunctive sense in writing the root of a quadratic equation. Thus, if  $x^2 - x = 1$ , we write  $x = \frac{1}{2}(1 \pm \sqrt{5})$ , meaning that the equation is satisfied only by the two values  $x = \frac{1}{2}(1 + \sqrt{5})$  and  $x = \frac{1}{2}(1 - \sqrt{5})$ . The sign  $\pm$  is also used in astronomy, geodesy, etc., after a value determined by observation, to introduce the probable error of that determination. Summation is also signified by the letter  $\Sigma$ .

Thus,  $\Sigma (1/i)$  means that in the expression  $1/i$  all the whole numbers from 1 to  $a$  inclusive are to be successively substituted for  $i$  and the resulting values added together to give the quantity denoted by the expression. When the limits are not indicated, the lower one is to be understood as constant, and generally zero, and the upper one as one less than the actual value of the variable. For example, if we write  $\Sigma (2x + 1) = x^2$ , this signifies

$$\sum_{n=0}^{x-1} (2n + 1) = x^2.$$

In like manner,  $\Delta$  is used to signify the difference, or the amount by which the quantity written after it would be increased by increasing the variable by unity. The variable may be indicated by a subjunctive letter; thus,  $\Delta x^2 = (x+1)^2 - x^2$ ; but  $\Delta x^2 = x^2 + 1 - x^2 = (x+1)x^2$ . The product of two quantities is denoted by writing them in their order, either directly, or with an interposed cross ( $\times$ ) or dot ( $\cdot$ ); thus,  $3 \times a = 3a$ ,  $a \cdot 3a$ . A quotient is usually denoted by one of the signs  $\div$  or  $/$ , with the dividend before it and the divisor after it, or by a horizontal line with the dividend above and the divisor below. A continued product is also written with  $\Pi$ , just as a summation is written with  $\Sigma$ ; but when the limits are not indicated, the lower one is constant, and generally unity, and the upper one the actual value of the variable. A positive whole number with the mark of admiration (!) after it denotes the continued product of all numbers from 1 up to that number inclusive; thus,  $4! = 24$ . Instead of the mark of admiration, a right-angled line beneath and at the left of the number is sometimes used; as,  $4!$ . A power of a quantity is denoted by writing the exponent to the right and above the base; thus,  $x^3 = x \cdot x \cdot x$ . This notation is extended to symbols of operation. Thus,  $\Delta^2 x = \Delta \Delta x$ ; and  $\Delta^{-1} u = \Sigma u$ , because  $u = \Delta \Delta^{-1} u = \Sigma \Delta u$ . If the exponent is the continued product of a number of factors equal to the exponent, one factor being the base, and the others the results of successive subtractions of 1 from the base; thus,  $x(3) = x(x-1)(x-2)$ . A root is denoted either by a fractional exponent, or by the sign  $\sqrt[n]{}$  written before the base, with the index above and to the left; thus,  $\sqrt[3]{8} = 2$ . If the index is omitted, it is understood to be 2. One of the most important parts of algebraical notation is the use of parentheses, ( ), square brackets, [ ], braces, { }, and vincula or horizontal lines above the expressions, to signify that the symbols so included are to be treated as signifying one quantity. Thus,  $(3+2) \times 5 = 25$ , but  $3 + (2 \times 5) = 13$ . Functions are usually denoted by operative symbols, especially  $f$ ,  $F$ ,  $\phi$ ,  $\psi$ , written before the variable, the latter being often enclosed in parentheses. If there are several variables, these are enclosed in one parenthesis and separated by commas, as  $F(x, y)$ . Various special functions have special abbreviations, as  $\log$  for logarithm,  $\sin$  for sine,  $\cos$  for cosine,  $\tan$  for tangent,  $\cot$  for cotangent,  $\sec$  for secant,  $\csc$  for cosecant,  $\text{versin}$  for versed sine,  $\text{sinh}$  for hyperbolic sine,  $\text{am}$  for amplitude,  $\text{sn}$  for sine of the amplitude,  $\text{cn}$  for cosine of the amplitude, etc. (For the special notation of matrices, determinants, graphs, and groups, see those words.) A differential is expressed by  $d$  before the function, and a partial differential is now generally written with  $\partial$  instead of  $d$ ; the variable is indicated, if necessary, by a subjunctive letter. A variation is expressed by  $\delta$  before the varying quantity. A differential coefficient is most frequently expressed fractionally as a ratio of differentials, or by  $\frac{d}{dx}$ , etc., written before the function. But the capital  $D$  is often used; thus,  $Dx^2 = 2x$ , and  $Dx^2 = \log x \cdot x^2$ . Differentiation relatively to the time is frequently expressed by accents; thus,  $\dot{x} = Dx$  and  $\ddot{x} = D^2x$ . Dots over the letters are also used under the accents, this being the original fluxional notation of Newton. The differential coefficients of a function are frequently denoted by accents attached to the operational symbols; thus,  $f'x = Df_x$ . A number of other differential operations are indicated by special operational symbols, as  $\nabla$  for Laplace's operator. The integral of an expression is written with the sign  $\int$ , introduced by Leibnitz, before the differential. The limits of a definite integral are written above and below this sign. Besides these notations, there are many others peculiar to different branches of mathematics.

34. Etymological signification; etymology. The notation of a word is when the original thereof is sought out, and consisteth in two things: the kind and the figure. B. Jonson, Eng. Grammar, viii. Conscience is a Latin word, and, according to the very notation of it, imports a double or joint knowledge. South.

4. In music, the act, process, or result of indicating musical facts by written or printed characters. As a process and a science, musical notation is a branch of semiotics or semiography in general. Notation is also used as a collective term for all the signs for musical facts taken together. Notation, whether regarded as a science or as a body of visible characters, may be divided into notation of pitch, of duration, of force, of style, etc. The various historic systems of notation are more particular about pitch than about the other matters. (a) The absolute and relative pitch of tones has been represented by letters, by neumes, by syllables, by numerals, by a staff, and by more than one of these methods at once. The ancient Greeks and Romans used their alphabets, assigning sometimes a separate letter or similar character to each tone of their tonal systems, and sometimes using only seven letters, which were repeated for successive octaves. The medieval notations included all the different methods, used both separately and in conjunction, letter-names being derived from the ancient notations, neumes appearing

early from an unknown source, and solmization and the staff-system being invented and developed from about the eighth or ninth century. Modern notations include all varieties except neumes. See letter-name, neume, solmization, musical, keyboard, scale, staff, etc. (b) The absolute and relative duration of tones has been much less fully indicated than pitch. The ancient and medieval systems were decidedly defective in this regard. The appearance about the twelfth century of measurable music necessitated the use of characters having a definite metrical value; hence came the note-system, which was combined with the staff, and also the various systems of tablature. In modern music two methods are used—notes whose shape indicates relative time-value, and a kind of tablature peculiar to the tonic sol-fa system. (See note, tablature, tonic sol-fa (under tonic), etc.) Furthermore, the general tempo of a piece or passage is indicated by such Italian terms as *grave*, *adagio*, *andante*, *moderato*, *allegro*, *crescendo*, *presto*, etc. Alterations of tempo during a piece are indicated by *accelerando*, *piu mosso*, *stringendo*, *ritardando*, *ritenuto*, *crescendo*, etc. The metrical treatment of individual tones is marked by *staccato*, *legato*, etc. (c) The absolute and relative force or accent of tones is still less fully indicated than pitch or duration. Vertical lines called *bars* have been used since medieval times to indicate rhythmical and metrical sections or measures, each of which begins with a primary accent. In modern music various words and arbitrary signs are used, as *forte*, *piano*, *crescendo* ( $<<$ ), *diminuendo* ( $>>$ ), *marcato*, etc. (d) Other signs of various practical import are the *basso*, *repet*, *da capo*, *dal segno*, *double bar*, *star*, etc. See these words. (e) The general style of a piece or passage is often indicated in modern music by such terms as *ad libitum*, *adagio*, *arpeggio*, *cantabile*, *espressivo*, *sostenuto*, *con brio*. (f) Specific directions about performance by the voice or an instrument also occur, as *mezzo voce*, *acuto*, *portamento*, *divisi*, *mano sinistra*, *pizzicato*, *sea (ottava)*, *pedal*, and many others. All these verbal marks are translated into different languages, and are subject to modification for particular effects. (g) Modern music, following the later medieval music, also employs to some extent a kind of numerical shorthand for harmonic facts. See *through bass*, and *figured bass* (under *basso*).—Alphabetic notation, in music. See def. 4 (a).—Architectural notation, a method adopted of placing signs to figures when marking dimensions on drawings: as 'for feet,' for inches, and 'for parts,' etc.—Chemical notation, a system of abbreviating and condensing statements of the chemical composition of bodies, and of their changes and transformations, by means of symbols. See chemical formula, under chemical.—Decimal notation. See decimal.—Neumatic notation, in music. See def. 4 (a), above, and also neume.—Numerical notation, in music. In *printing*: (a) An explanatory statement, or reference to authority quoted, appended to textual matter and set in smaller type than the text. Notes are of several kinds. A *center-note* is placed between two columns, as in cross-references in some editions of the Bible. A *side-note* or *marginal note* is placed in the outer margin of the page, parallel with the lines of the text. A *foot-note*, or *bottom note*, follows the text at the foot of the page, but does not encroach on the margin, as *side-notes* do. A *shoulder-note* is one at the upper inner corner of a page. In some countries, as China and Japan, all notes are placed at the top of the page. (b) One of the marks used in punctuating the text: as, the *note* of admiration or of exclamation (!); the *note* of interrogation (?).

A *note* is, in a strict sense, an official communication in writing from the Department of Foreign Affairs (or of State) to a foreign diplomatic representative, or vice versa; it is distinguished from an *instruction*, sent by the department to one of its own diplomatic or consular representatives abroad, and from a *despatch*, sent by the representative abroad to his own department at home.

The pitch of the tone is indicated by the position of the note on the staff relative to the clef and the key-signature. (See *staff*, *clef*, *signature*, *key*.) The relative duration of the tone is indicated by the shape of the note. The system of notes now in use includes the following: the *breve*,  $\text{—}$ ; the *semi-breve* or *whole-note*,  $\text{—}$ ; the *minim* or *half-note*,  $\text{—}$ ; the *crotchet* or *quarter-note*,  $\text{—}$ ; the *quaver* or *eighth-note*,  $\text{—}$ ; the *semiquaver* or *sixteenth-note*,  $\text{—}$ ; the *demisemiquaver* or *thirty-second-note*,  $\text{—}$ ; and the *hemidemisemiquaver* or *sixty-fourth-note*,  $\text{—}$ .

Each of these notes may be placed upon any staff-degree, and thus may signify a tone of any pitch whatever. Each of them, also, may have any time-value whatever, but when in a particular piece or passage a definite time-value is assumed for any one of them, a breve is then regarded equal in that piece or passage to two semibreves, a semibreve to two minims, a minim to two crotchets, etc. In other words, as a metrical notation, this system of notes is relative to an assumed value for one species, but absolute and definite after such an assumption. The pitch-value of a note may be modified by an *accidental* (which see), though the latter may also be regarded as changing the staff rather than the note. The time-value of a note may be modified by various marks,

such as a *dot* after it (as  $\text{—}$  or  $\text{—}$ ), which lengthens the note by one half its original value; the *tie* ( $\text{—}$  or  $\text{—}$ ), which binds two notes on the same pitch together and adds their respective values together; the *pause*, *hold*, or *fermata* ( $\text{—}$  or  $\text{—}$ ), which lengthens the value of the note indefinitely according to the will of the performer; the *staccato* ( $\text{—}$  or  $\text{—}$ ), which shortens the actual duration of the note and supplies the deficiency by a silence or rest. (See the various words.) This system is derived from the medieval systems, though with important changes. The Gregorian system of notes, which is still in use, is much nearer to the medieval system. It includes the following notes: the *large*,  $\text{—}$ ; the *long*,  $\text{—}$ ; the *breve*,  $\text{—}$ ; and the *semibreve*,  $\text{—}$  or  $\text{—}$ . These in turn were derived from the early neumes. They were first used merely as indications of pitch, their time-value being indefinite, and dependent wholly upon the text sung to them; but they acquired a definite metrical significance under mensural music. In modern usage they are generally treated as metrical. A special development of the ordinary system of notes is that of *character-notes*, which are varied in shape so as to indicate not only various time-values, but also the scale-values or characteristic qualities of the tones indicated. Thus, the tonic or *do* is always represented by one shape, the dominant or *sol* by another, the subdominant or *fa* by a third, etc. The system thus aims to secure at once the utility of the staff and of a reference to the abstract scale. (b) A musical sound or tone, in general or particular: as, the *note* of a bird; the first *note* of a song, etc. [This use of the word, as applied to musical tones, is very common, but is confusing and inaccurate.]

**6.** In *law*: (*a*) Information; knowledge of facts: more specifically designated *actual notice*. Actual notice may be inferred from circumstances, as where proof of due mailing of a letter justifies the inference that he to whom it was addressed became cognizant of its contents; but he may disprove the fact, and

thus destroy the inference. (*b*) Such circumstances as ought to excite the attention of a person of ordinary prudence, and lead him to make further inquiry which would disclose the fact: more specifically designated *constructive notice*. Constructive notice is imputed by the law irrespective of the existence of actual notice, as where a deed is recorded, and a purchaser of the land neglects to consult the record, in which case the record is constructive notice; or where a purchaser takes a title from the former owner of land, relying on the fact that the record title is in him, while in fact a prior purchaser is in actual possession of the land, having paid for it, in which case the possession is constructive notice; and in either case the later purchaser, not having made inquiry, may be chargeable as if he had had actual notice of the prior purchaser's right. Constructive notice originated in the equitable rule that a man may, for the protection of the rights of a third person, be treated as if he had notice, when he had the means of information. (*c*) Information communicated by one party in interest to another, as where a contract provides that it may be terminated by either party on notice: more specifically designated *express notice*. The effect of such a notice is to charge the drawer or indorser with liability as such.—**Notice of protest**, in *com. law*, a notice of dishonor which states that a bill or note has been protested. But this term is often used in the popular sense of protest as not necessarily implying technical notarial protest, except in the case of paper, such as a foreign bill, which requires such technical protest.—**Reading notice**, a paid advertisement in a newspaper inserted in such form, style of type, etc., as to have the appearance of current news-matter or of an editorial utterance.—**To give notice**, (*a*) To inform; announce beforehand; warn; notify. A general concept; a mental representation of a state of things. Thus, the general enunciation of a geometrical theorem is comprehended by means of notions, and only in that way can the property to be proved be firmly seized by the mind, and kept distinct from other properties of the same figure; but in order to prove the theorem a construction or diagram is requisite, involving a representation in the imagination capable of being studied so as to observe hitherto unknown relations in it.

A complexion of *notions* is nothing else but an affirmation or negation in the understanding or speech.

*Burgersdicius*, tr. by a Gentleman, I. ii. 4.

Concept or *notion* are terms employed as convertible; but, while they denote the same thing, they denote it in a different point of view. Conception, the act of which concept is the result, expresses the act of comprehending or grasping up into unity the various qualities by which an object is characterized; *notion*, again, signifies either the act of apprehending, signaling—that is, the remarking or taking note of the various notes, marks, or characters of an object which its qualities afford; or the result of that act. . . . The term *notion*, like conception, expresses both an act and its product.

3. In the *Lockian philos.*, a complex idea.

The mind often exercises an active power in making these several combinations; for, it being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so in nature. And hence I think it is that these ideas are called *notions*, as if they had their original and constant existence more in the thoughts of men than in the reality of things.

**notochord** (nō'tō-kōrd), *n.* [*< Gr. νωτορ, the back, + χῶρδ, a string.*] The chorda dorsalis or primitive backbone; a fibrocellular or cartilaginous rod-like structure which is developed in vertebrates as the basis of the future spinal column, and about which the bodies of the future vertebrae are formed. It is one of the earliest embryonic structures, and persists throughout life in many of the lower vertebrates, which are on this account called *notochordates*; but in most cases it is soon absorbed and replaced by a definite cartilaginous or bony spinal column. The soft pulpy substance which may be seen filling in the cupped ends of the vertebra of a fish as brought to the table, is a part of the remains of the notochord. Anteriorly, in skulled vertebrates, the notochord runs into the base of the skull as far as the pituitary fossa. (See *parachordal*.) The canal division of a notochord is often called *urochord*. Such a structure is characteristic of tunicates or ascidians, called on this account *Urochordata*, and approximated to or included among vertebrates. (See *Appendicularia*.) A sort of notochord occurring in the acorn worms has caused them to be named *Hemichordata*. (See *Lanceolatus* and *Enteropneusta*.) The lancelets are named *Cephalochordata* with reference to the extension of this structure into the head. See *Chordata*, and cuts under *Pharyngobranchii*, *Chondroceratium*, *Lepidosiren*, and *Rissolea*.

Though parasitic, they are gnathostomous (not siphonostomous), and have a segmented body, resembling that of the *Cyclopidae*, but the last two thoracic segments of the female are fused into a brood-pouch, whence the name. The posterior antennae are modified for attachment, and the creatures live in the branchial cavity of ascidians.

**Notodelphys** (nō-tō-del-fis), *n.* [NL., *< Gr. νωτορ, the back, + δελφίς, the womb.*] A genus of parasitic copepod crustaceans, resembling ordinary copepods, but carrying their ova in a cavity upon the back of the carapace. *N. agilis* is a common parasite of the branchial chamber of ascidians.

The habit is not geometridiform; the body is unusually stout; the proboscis is very short, if it appears at all; the pupa are usually of moderate length; the antennae are moderate, setaceous in the male, usually pectinate and rarely simple, in the female usually simple and rarely subpectinate; and the wings are deflexed, entire, and usually long, with the submedian vein of the hind ones overrunning to the anal angle. It is a large family of nearly 100 genera. The larvae are naked, often curiously ornamented or armed, and they pupate either under or above ground. Some of them are known as *pebbles, prominent, and toothbacks*.

The membrane is distinctly marked, the body is broad, the scutellum is about as wide as the pronotum, and the front is narrow and curved without swelling or prolongation. These insects are all aquatic and predaceous, and swim about on their backs, whence the names *Notonecta* and also *back-swimmer* and *water-batman*. The genus is wide-spread, being represented almost everywhere. *N. undulata* is the commonest species in the United States; it is half an inch long, and varies in color from an ivory-white to a dusky hue. *N. americana* is the handsomest one, being brightly colored with red and yellow. The group is sometimes retained in a modified sense, as including transitional forms between the brachyurous and the macrurous decapods, as *Dromiidae*, *Lithodidae*, and *Porcellanidae*. One or two pairs of legs are articulated higher up than the rest, whence the name. 2. In *entom.*, a name of the elaters, or skip-jacks. See *Elateridae*.

In *civil law*, a new or supplemental constitution or decree; one of the novel constitutions of certain Roman emperors, so called because they appeared after the authentic publications of law made by these emperors. Those of Justinian (A. D. 527-65) are the best-known, and are commonly understood when the term is used. The *Novels*, together with the *Institute*, *Code*, and *Digest*, form the body of law which passes under the name of Justinian. Also *novella*.

By the civil law, no one was to be ordained a presbyter till he was thirty-five years of age; though by a later *novel* it was sufficient if he was above thirty.

The famous decision which Glanville quotes about legitimization is embodied in what then was an Extravagant of Alexander III., delivered to the bishop of Exeter in 1172, founded no doubt on a *Novel* of Justinian, but not till now distinctly made a part of church law.

4. A fictitious prose narrative or tale, involving some plot of more or less intricacy, and aiming to present a picture of real life in the historical period and society to which the persons, manners, and modes of speech, as well as the scenery and surroundings, are supposed to belong. Its method is dramatic, and the novel may be regarded as a narrative play to the extent that the various persons or characters, upon whose qualities and actions the development and consummation of the plot or motive depend, are brought upon the scene to play their several parts according to their different personalities, disclosing, with the aid of the author's delineation and analysis, diverse aspects of passion and purpose, and contributing their various parts to the machinery of the drama to be enacted among them. The novel may be regarded as representing the third stage of transition in the evolution of fictitious narrative, of which the epic was the first and the romance the second. The novel in its most recent form may be divided, according to its dominant theme or motive, into the philosophical, the political, the historical, the descriptive, the social, and the sentimental novel; to which may be added, as special forms, the novel of adventure, the novel of society, the novel of character, the novel of criticism and satire, the novel of reform, and the military, the nautical, and the sporting novel.

Our Amours can't furnish out a Romance; they'll make a very pretty *Novel*.

**Dime novel.** See *dime*. — **Novels** (or **Novellæ**) of **Justinian**. See def. 3. = **Syn. 4. Tale, Romance, Novel.** *Tale* was at one time a favorite word for what would now be called a *novel*, as the *tales* of Miss Austen, and it is still used for a fiction whose chief interest lies in its events, as Marryat's *sea tales*. "Works of fiction may be divided into *romances* and *novels*. . . . The *romance* chooses the characters from remote, unfamiliar quarters, gives them a fanciful elevation in power and prowess, surrounds them by novel circumstances, verges on the supernatural or passes its limits, and makes much of fictitious sentiments, such as those which characterized chivalry. The poor sensational *novel* has points of close union with the earlier *romance*. . . . The *novel*, so far as it adheres to truth, and treats of life broadly, descending to the lowest in grade, deeply and with spiritual forecast, seeing to the bottom, is not only not open to these objections, but rather calls for commendation." (a) In De Blainville's classification (1824), the last one of five orders of the second section of his *Paracéphalophora monica*, divided into two families, *Nectopoda* and *Pteropoda*. The term is generally held to be a synonym of *Heteropoda*, but it is partly a synonym of *Pteropoda*, and these two groups are not exactly distinguished in the two families into which the author divides his nucleobranchs. Moreover, the order does not contain the genus *Carolinia*, which is pteropodous, and does contain the genus *Argonauta*, which is cephalopodous. It therefore corresponds to no natural group, and is disused. See *Nectopoda* and *Heteropoda*. (b) By some recent conchologists used as a substitute for *Heteropoda*.

In *zool.*, the nucleus of a nucleus; one of the rounded deeply staining structures found in the nucleus of a cell. The relation they bear to the nuclear network is still uncertain. Some consider them as distinct from the nuclear network (Hemmings); others consider them as merely thickened knots of

the network (Klein). The nucleolus of the human ovum was discovered by Wagner in 1836, and hence is sometimes called the *spot of Wagner* in anatomical text-books. See cut under *cell*, 5.

A large, clear, spherical nucleus is seen in the interior of the nerve-cell; and in the centre of this is a well-defined small round particle, the *nucleolus*.

Huxley, Crayfish, p. 187.

2†. Specifically, in *Lufuscarat*, a minute particle attached to the exterior of the nucleus (or "ovary"), supposed to function as a testicle. But since it is the essential characteristic of a nucleolus to be contained within a nucleus, these so-called nucleoli of protozoans are now differently interpreted, and called *paranuclei*. See *paranucleus*.

3. In *hol*, a small solid rounded granule or particle in the interior of the nucleus. There may be several nucleoli in each nucleus.

**nucleoplasm** (nū'klē-ō-plazm), *n.* [*< L. nucleus*, a kernel, + *NL. plasma* = *E. plasma*.] The more fluid part of the nucleus, found between the nuclear threads. See *nucleus*, 1 (a).

A kernel; hence, a central mass about which matter is collected, or to which accretion is made; any body or thing that serves as a center of aggregation or assemblage; figuratively, something existing as an initial or focal point or aggregate; as, a *nucleus* of truth; a *nucleus* of civilization.

Then, such stories get to be true in a certain sense, and indeed in that sense may be called true throughout; for the very *nucleus*, the fiction in them, seems to have come out of the heart of man in a way that cannot be imitated of malice.

Hawthorne, Septimus Felton, p. 111.

The regiments fashioned by his [Cromwell's] master hand, steady, perfectly ordered, and enthusiastic in their cause, became the *nucleus* of the far-famed Ironsides.

Edinburgh Rev., CLXV, 465.

(a) In *biol.*, the kernel of a cell, in general; a central or interior differentiated mass of protoplasm, found in nearly all cells, vegetable or animal, and consisting of an oval or rounded body composed of (1) a nuclear membrane, (2) nuclear network, and (3) nucleoplasm, and containing nucleoli. The nuclear network is made up of threads or fibrils which are composed of a deeply staining part, "chromatin," and a feebly staining intermediate substance, "luin" or parachromatin (nucleohyaloplasm). In the meshes of the network is found the more fluid part of the nucleus, the nucleoplasm (achromatin, karyochylema, paralinin). Nucleoplasm, according to Carnoy, consists of a plastic network and a granular fluid, "enchylema." The nuclear membrane is considered by some observers to be an inner limiting layer of cell-protoplasm surrounding the nucleus, by others to be a condensation of the peripheral portion of the nuclear network. There may be but one nucleus or several nuclei in one cell; and a nucleus may be nucleolate or not. Nuclei are generally proportionate in size to the cell containing them; in some instances, however, they form almost the entire cell mass. A structural difference between the nucleus and the rest of the cell-protoplasm is indicated by its greater resistance to powerful reagents, and by its varied reaction with stains. Functionally, the nucleus is the most important portion of the cell, as it is here that the complex series of changes known as karyokinesis take place, resulting in the division of the nucleus and followed by the division of the cell. This process of mitosis or indirect cell-division is found in all varieties of cells, whether vegetable or animal, fetal or adult, normal or pathological. Instances of cell-division not mitotic have, however, been noted. The nucleus of the human ovum was discovered by Purkinje in 1825, and hence is often called the *corpuscle of Purkinje*. Its usual name in text-books of anatomy is *germinal vesicle*. See cut under *cell*, 5. (b) In *zool.*: (1) In ascidians, the alimentary and reproductive viscera collectively when these are aggregated into a mass, as in the salps. (2) In protozoans, a solid rod like or strap shaped body, having in many cases the functions of an ovary in connection with a nucleolus (see *nucleolus*, 2). (3) In echinoderms, the madreporiform body. (c) In *anat.*, a collection of ganglion-cells in the brain or other portion of the cerebral spinal axis. (d) In *conch.*, the embryonic shell which remains at the apex of the mature shell, as of a gastropod; also, the initial point from which the operculum of a gastropod grows. See *proboscis*. (e) A body having a stronger or weaker attraction for the gas, vapor, or salt of a solution than for the liquid part of it, and therefore modifying by its presence the freezing- and boiling-points. *Rosier*. (f) In *astron.*, the bright central point usually present in the head of a comet and often in a nebula.

**5.** In *law*, such a use of property or such a course of conduct as, irrespective of actual trespass against others or of malicious or actual criminal intent, transgresses the just restrictions upon use or conduct which the proximity of other persons or property in civilized communities imposes upon what would otherwise be rightful freedom. Thus, the use of steam-power, though on one's own premises and for a lawful purpose, may be a *nuisance*, if by reason of being in one of several closely built dwellings the vibration and noise cause unreasonable injury to the adjacent property and occupants. Any serious obstruction to a highway or navigable river if not authorized by law is a *nuisance*; but the temporary use of a reasonable part of a highway for a legitimate purpose, such as the moving of a building or the deposit of building materials going into use, is not necessarily a *nuisance*. The question of *nuisance* always is, at what point the selfish use of a right transcends the obligation to respect the welfare of others. A *common nuisance*, or *public nuisance*, is one which tends to the annoyance of the public generally, and is therefore to be redressed by forcible abatement or by an action by the state, as distinguished from a *private nuisance*, or one which causes special injury to one or more individuals and therefore will sustain a private action. Thus, if one obstructs a highway any person may remove the obstruction, but only the public can prosecute the offender, unless a particular individual suffers special injury, as where he is turned from his road and compelled to go another way and suffers thereby a specific pecuniary damage, in which case it is as to him a private *nuisance*, and he may sue.

of beads; much used for rounds of chairs, bedsteads of the cheaper sort, etc. In operation, the lever *a* is lifted by the left hand, while the right hand grasps the upwardly extending handle of the carriage. This brings the knife *g* into action, and by moving the carriage longitudinally the stick is turned round. Next the lever *a* is lowered into the position shown, and by moving it up and down the arm *c* engages the teeth of the rack *e* successively, bringing the knives held in *b, b* into action, which form the beads one after another.

also used substantively, especially as *fractionals*. *Multiplicatives* are such as *tenfold, tenfold*, etc.; and *distributives*, answering to our *two by two*, etc., are found in some languages. Such words as *many, all, any* are often called *indefinite numerals*. *Numeral adverbs* are such as *once, twice, thrice*, and *firstly, secondly, thirdly*, etc.

**nunc** (nungk), *n.* [Prop. \**nunk*, unless it is an error for *nunch*: see *nunch*.] A large lump or thick piece of anything. *Halliwel*. [Prov. Eng.]

**Nunc Dimittis** (nungk di-mit'is). [So named from the first two words in the Latin version, *nunc dimittis servum tuum, Domine*. . . in pace, 'now lettest thou thy servant depart in peace': *L. nunc*, now (see *now*); *dimittis*, 2d pers. sing. pres. ind. of *dimittere*, send forth, send away, dismiss; see *dismiss*.] The canticle of Simeon (Luke ii. 29-32). The *Nunc Dimittis* forms part of the private thanksgiving of the priest after the liturgy in the Greek Church, and is frequently sung by the choir after celebration of the eucharist in Anglican churches. It forms part of the office of complin as used in the Roman Catholic Church or in religious communities in the Anglican Church. It is contained in the vesper office of the Greek Church, and is one of the canticles at evening prayer in the Anglican Church.

**nunch** (nunch), *n.* [Prob. a dial. var. of *lunch* or *hunch*, the form *nunc*, so spelled in Halliwel, being either for \**nunk* (cf. *hunk*) or for *nunch*. The variation of the initial consonant in such homely monosyllables is not extraordinary. The same or like words vary also terminally: cf. *hunk*, *hunch*, *lump*, *lunch*, *lump*, *lunch*, *bump*, etc. But *nunch* may arise from *nunch*, if that is of ME. origin: see *nunchcon*.]

1. A lump or piece. Compare *nunc*.—2. A slight repast: a lunch or luncheon. Compare *nunchcon*. *Halliwel*. [Prov. Eng.]

**nunchcon** (nun'ehon), *n.* [Formerly also *nunchion*, *nunchin*, *nunchion*, *nunchion*, *nunchion*; appar. for \**nunching* (as *lunchcon* for \**lunching*), *< nunch*, a piece, + *-ing*.] As with the equiv. *lunchcon*, also orig. dial., the termination lost meaning, and the word was altered by popular etym. to *nunchion*, and even in one case to *nunchion*, as if a repast taken when the laborers 'shun' the heat of 'noon', *< noon* + *shun*; the association with *noon* being either accidental, or else due to the origination of *nunchcon*, as Skeat claims, in the rare ME. *nunchenche* for \**nunchschenche*, a donation for drink, lit. 'noon-

drink,' *< none*, noon, + *schenche*, a cup (hence 'drink'), *< schenchen*, *shenchen*, *shenken*, *skinken*, give to drink: see *noon* and *skink*. The reduction of ME. \**nunchschenche* to *nunchcon* is irregular, but is possible, the form \**nunchschenche* being awkward and unstable. Cf. *noonmeal* and *bever*.] A light meal taken in the middle of the day; a luncheon.

A repast between dinner and supper, a *nunchin*, a better and andersinate.

Breakfast, dinner, *nunchions*, supper, and bever.

A papal ambassador of the first rank sent on a special temporary mission is styled a *legate*. (see *legate*.) *Nuncios* formerly acted as judges of appeal. In Roman Catholic kingdoms and states holding themselves independent of the court of Rome in matters of discipline, the nuncio has merely a diplomatic character, like the minister of any other foreign power.

A certain restraint was given out, charging his *nuncios* and legates (whom he had sent for the gathering of the first fruits of the benefices vacant within the realm), etc.

Foxt, Martyrs, p. 417.

Fotherby, Athomastix, p. 41. (Latham.)

2. In the law of wills, oral; not written; made or declared by word of mouth. A nuncupative will is made by the verbal declaration of the testator, and usually depends merely on oral testimony for proof. Nuncupative wills are now sanctioned when made by soldiers in actual military service, or mariners or seamen at sea. In Scots law, a nuncupative legacy is good to the extent of £100 Scots, or £8 6s. 8d. sterling. If it exceed that sum it will be effectual to that extent, if the legatee choose so to restrict it, but ineffectual as to the rest. A nuncupative or verbal nomination of an executor is ineffectual.

He left me a small legacy in a *nuncupative* will, as a token of his kindness for me.

Franklin, Autobiography, p. 88.

2. In *pathol.*, a constant nodding or involuntary shaking of the head. *Dunghson*.—3. In *astron.*, a small subordinate gyratory movement of the earth's axis, in virtue of which, if it subsisted alone, the pole would describe among the stars, in a period of about nineteen years, a minute ellipse, having its longer axis directed toward the pole of the ecliptic, and the shorter, of course, at right angles to it. The consequence of this real motion of the pole is an apparent approach and recession of all the stars in the heavens to the pole in the same period; and the same cause will give rise to a small alternate advance and recession of the equinoctial points, by which both the longitudes and the right ascensions of the stars will be also alternately increased or diminished. This nutation, however, is combined with another motion—namely, the precession of the equinoxes—and in virtue of the two motions the path which the pole describes is neither an ellipse nor a circle, but a gently undulated ring; and these undulations constitute each of them a nutation of the earth's axis. Both these motions and their combined effect arise from the same physical cause—namely, the action of the sun and moon upon the protuberant mass at the earth's equator. See *precession*.

The phenomena of Precession and Nutation result from the earth's being not centrobatic, and therefore attracting the sun and moon, and experiencing reactions from them, in lines which do not pass precisely through the earth's centre of inertia, except when they are in the plane of its equator. *Thomson and Tait*, *Nat. Phil.*, § 825.

by the numerous carpels being wholly immersed in and consolidated with the thick receptacle. The numerous yellow stamens and stamen-like petals are densely imbricated around the ovary; the few sepals are thick and roundish, making a rather globular flower. The leaves are petate with a deep sinus, floating or emersed, and, with the one-flowered scapes, arise from a perennial rootstock creeping in bottom-mud. See *water-lily*, *lily*, *lily*, *brandy-bottle*, *lotus*, *2*, *pond-lily*, and *spatterdock*.

It belongs to the order *Nymphaeaceae* and the suborder *Nymphaeae*, and is marked by the carpels being more or less immersed in the receptacle, the numerous petals and the stamens into which they gradually pass becoming inwardly more and more adnate to the receptacle about the carpels. See *water-lily*, *nymphar*, *pond-lily*, and *lotus*. (See also *introrse*.)

1. The fifteenth letter and fourth vowel in our alphabet. It followed *X* also in the Italian systems, but was separated from it in Greek and Phœnician by another character, which in the latter had the value of a sibilant, and in the former that of the compound *ks* (ξ). The *O*-character, accordingly, was the sixteenth in the Phœnician alphabet, and it represented there the 'ain, a very peculiar and to us unpronounceable guttural; (the Greeks (as in the case of *E*: see that letter) arbitrarily changed its value to that of a vowel, corresponding in quality to our "long *o*." There is no traceable Egyptian prototype for the character; the comparison of older forms is therefore as follows:

It thus appears that the belief, not uncommonly held, that *O* represents, and is imitated from, the rounded position of the lips in its utterance, is a delusion. The historical value of the letter (as already noticed) is that of our *o*, in *note*, etc., whether of both long and short quantities, as in Latin and the earliest Greek, or of short only, as in Greek after the addition to that alphabet of a special sign for long *o* (namely *omega*, Ω, ω). This vowel-sound, the name-sound of *o*, is found in English usage only with long quantity in accented syllables. There is no closely corresponding short vowel in standard English, but only in dialectal pronunciation, as in the New England utterance of certain words (much varying in number in different individuals); for example, *hone*, *whole*, *none*. What we call "short *o*" (in *not*, *on*, etc.) is a sound of altogether different quality, very near to a true short *a* (that is, a short utterance corresponding to the *a* of *arm*, *father*), but verging slightly toward the "broad" *a* (*ā*) or *o* (*ō*) of *land*, *lord*. "Short *o*" has a marked tendency to take on a "broader" sound, especially before *r*, and especially in America; hence the use, in the respellings of this work, of *ō*, which varies in different months from the full sound of *ā* to that of *ō*. After these three values of the character, the next most common one is that of the *oo*-sound, the original and proper sound of *u* (represented in this work by *u*), as in *move*, with the nearly corresponding short sound (marked *ū*) in a few words, as *wolf*, *woman*. All these vowel-sounds partake of what is usually called a "labial" or a "rounded" character: that is to say, there is involved in their utterance a rounding and closing movement of the lips (and, it is held, of the whole mouth-cavity), in different degrees — least of all in *ō*, more and more in *ā*, *ō*, *ū*, *o*; in the last, carried to its extreme, no closer rounding and approximation being possible. The labial action helps to give the vowel-sounds in question their fully distinctive character; but it can be more or less slighted without leaving them unrecognizable, and, in the generally indifferent habit of English pronunciation, is in a degree neglected, even in accented syllables, and yet more in unaccented. Our "long *ō*," it should be added, regularly ends with a vanishing sound of *oo* (*ū*), as our *ā* with one of *ē*. *O* also has in many words the value of the "neutral" vowels of *hut*, *hurt*: for example, in *son*, *come*, *love*, *work*. *O* is further a member of several very common and important digraphs: thus, *on*, the most marked representative of the *o*-sound (in *anon*, *road*, etc.), but also pronounced as *ū* (*book*, *look*, etc.) and *ū* (*blood*, etc.); *ou* (in certain situations *ou*), oftenest representing a real diphthong (in *out*, *sound*, *now*, etc.), but also a variety of other sounds (as in *through*, *could*, *ought*, *rough*); *oi* (in certain situations *oi*), standing for a real diphthongal sound of which the first element is the "broad" *o* or *a*-sound (for example, *point*, *boy*); *oa* (*load*, etc.), having the "long" *o*-sound; others, *aseen* (variously pronounced, as in *people*, *yeoman*, *jeopard*), *oe* (in *few*, *does*, etc.), are comparatively rare.

A tree or shrub of the genus *Quercus*, a large and widely dispersed group, chiefly of forest-trees. In its nobler representatives the oak as "the monarch of the forest" has always been impressive, and it anciently held an important place in religious and civil ceremonies. Oak chaplets were a reward of civic merit among the Romans; the Druids venerated the oak as well as the mistletoe which grows upon it. The timber of many species is of great economic value, and the bark of several is used for tanning and dyeing and in medicine. (See *oak bark* and *quercitron*.) One species furnishes cork (see *cork*). The fruit-cups of some are used in tanning (see *robinia*). (See also *oak*, *oak*, and *oak*.) The oak of English history and literature is chiefly the British oak *Quercus robur*, having two varieties, *pedunculata* and *sessiflora*, often regarded as species. The species is distributed throughout a great part of Europe and in western Asia. It attains great age, with an extreme height of 120 feet. For ship-building its timber is considered invaluable, having the requisite toughness and most other qualities without extreme weight, and until recently it was the prevailing material of British shipping. It is also used for construction, cabinet-work, etc. Its bark is

a tanning substance of great importance. In the eastern half of North America the white oak, *Q. alba*, in England sometimes called *Quebec oak*, occupies a somewhat similar but less commanding position. It rises from 70 to 140 feet, and affords a hard, tough, and durable wood, used, though not equal to the English oak, in ship-building, construction of all sorts, the manufacture of carriages and implements, cabinet-making, etc. The bur, overcup, or mossy-cup oak, *Q. macrocarpa*, is a tree of similar range, equal size, and even superior wood, which is not always distinguished from that of the white oak.

(Sc.) *oats*; *< ME. ate, aute*, earlier *ate* (usually in pl., *ates*, earlier *ates*, *< AS. āte* (in earliest form *āte*), pl. *ātan*, oat (tr. *L. arena*), also *oekle*, tares (tr. *L. lolium* and *zizania*); not found in other tongues. Some compare the leel. (dim.) *etill*, a nodule in stone, = Norw. *etel*, a knot, nodule, gland; also Russ. *yadro*, a kernel, ball, Gr. *αἶθερ*, a swelling (see *caluma*); the name being given, in this view, with ref. to its rounded shape. Other compare the AS. *etan*, E. *eat* (cf. *āt* (= Icel. *áta*, also *atli*), meat, prey); but why oats should be singled out, as 'that which has a rounded shape' or 'that which is eaten,' from other grains of which the same is equally or more true, is not clear.] 1. (a) A cereal plant, *Avena sativa*, or its seed; commonly used in the plural in a collective sense. The oat was already in cultivation before the Christian era, and is sown in a variety of soils in all cool climates, degenerating

*a*, a spikelet; *b*, the lower flowering glume with awn; *c*, the upper flowering glume; *d*, a neutral flower; *e*, grain enclosed by the flowering glumes and the palea, the awn detached.

toward the tropics, yet not ripening quite as far north as barley. Oats are grown chiefly as food for beasts, especially horses, being most largely so used in the United States; but they also form an important human food (especially in Scotland, of late years somewhat in the United States), in point of nutrition ranked higher by some than ordinary grades of wheat flour. (See *oatmeal, groats*, and *soups*.) All the varieties of the ordinary cultivated oat are referred to *A. sativa*, but this is believed by many to be derived from the wild oat, *A. fatua*. The race called *naked oat*, sometimes regarded as a species, *A. nuda*, differs from other sorts in having the seed free from the glume. It is successful in Ireland, etc., but not in America. A variety well approved in both hemispheres is the potato-oat, with a large white plump grain, the original of which was found growing accidentally with potatoes. The black Iceland is another esteemed variety, the Tartarian and the Siberian are recommended for poor soils. The varieties are numerous, new ones constantly appearing.

When green grew *oats* and barley,

The country squires brewed at home that strong ale which, after dinner, stood on the table in moderate heat with the *oat* and was drunk in lieu of wine.

*S. Dorell, Taxes in England, IV, 68.*

(b) Any species of *Avena*. The wild oat of Europe, *A. fatua*, is a weed of cultivation in many places in California, where it abounds; it is extensively utilized as hay. The animal, dry, or hygroscopic oat, *A. barbata*, native in Barbary, has two long, strong, much bent awns which twist and untwist with changes of moisture and so become a means of locomotion. Various species are more or less available for pasture.

Provision is made in the cases of those who have conscientious objections to the taking of an *oath*, or those who are objected to as incompetent to take an *oath*, whereby they are allowed to substitute an affirmation or solemn promise and declaration. — *Oaths* to perform illegal acts do not bind, nor do they excuse the performance of the act.

(c) An exclamatory word or phrase, usually without appropriateness to the subject in hand, expressing surprise, and generally displeasure, though sometimes even approval or admiration. It may refer to something sacred, and even be what is called blasphemous, but is often wholly unmeaning, or is a corruption or softening of an originally blasphemous expression, as *zounds!* for *God's* (Christ's) wounds, *egad* for *by God*, etc. — **Corporal oath.** See *corporal*.

=*Syn.* 1. *Obdurate, Callous, Hardened.* These words all retain the original meaning of physical hardening, although it is obsolescent with *obdurate*. In the moral signification, the figure is most felt in the use of *callous*, which indicates sensibilities to right and wrong deadened by hard treatment, like *callous* flesh. *Hardened* is less definite, it being not always clear whether the person is viewed as made hard by circumstances or as having *hardened* himself against better influences and proper claims. *Obdurate* is the strongest, and implies most of determination and active resistance. **obi**<sup>1</sup> (ô'bî), *n.* [Also *obea*, *obah*, *ohy*; said to be of African origin.] 1. A species of magical art or sorcery practised by the negroes in Africa, and formerly prevalent among those living in the West Indies, where it was introduced by African slaves. Traces of the same or similar superstitions and practices are still found both in the West Indies and in some of the southern United States. The charms used are bones, feathers, rags, and other trash, but it is upon a secret and skilful use of poison that the peculiar terror of the system is supposed to depend. The negroes have recourse to the *obi* for the cure of diseases, gratification of revenge, conciliation of enemies, discovery of theft, telling of fortunes, etc.

Things suffer in general; the slaves run away or are inclined to be turbulent; he [the bad head driver] and they cabal; bad sugar is made; and perhaps the horrid and abominable practice of *obea* is carried on, dismembering and disabling one another; even aiming at the existence of the white people.

Anything which is perceived, known, thought of, or signified; that toward which a cognitive act is directed; the non-ego considered as the correlate of a knowing ego. By the *object* may be meant either a mere aspect of the modification of consciousness, or the real external thing (whether mediately or immediately perceived) which affects the senses. Opposed to *subject*. [*Obiectum* in this sense came into use early in the thirteenth century. It is remarkable as not being a translation of a Greek word.]

5. In *gram.*: (a) A member of the sentence, a substantive word or phrase or clause, immediately (that is, without the intervention of a preposition) dependent on a verb, as expressing that on which the action expressed by the verb is exerted. The *object* of a verb is either *direct* or *indirect*. A direct *object* receives the direct action of the verb, and is in the accusative or objective case, so far as there is a distinctive form for that case, and a verb admitting such an *object* is called *transitive*; as, he saw me; they gave a book; an indirect *object* represents something (usually) to or for which the action is performed, and so is in the dative case, so far as that case is distinguished (as only imperfectly in English); thus, they gave her a book; I made the boy a coat; but in some languages indirect *objects* of other cases occur. A direct *object* which repeats in noun form an idea involved in the verb is called a *cognate object*; as, I dreamed a dream; they run a race. The name *factive object* is often given to an objective predicate. See *predicate*. (b) A similar member of the sentence dependent on a preposition, i. e. joined by a preposition to the word it limits or qualifies; as, he went with me; a man of spirit. Such an *object* is in English always in the accusative or objective case; in other languages often in other cases, as genitive, dative, ablative. The *object*, whether of a verb or of a preposition, is said to be *governed*—that is, required to be of a particular case—by the verb or preposition.

8†. An obstacle. [Rare.]

*Peter of Blois (trans.), in Stubbs's Medieval and Modern Hist., p. 143.*

**object-finder** (ob-jekt-fīn'dér), *n.* In microscopes, a device to enable the observer to fix the position of an object in the slide under examination, so that he can find it again at will. It is especially necessary when high powers are employed. Various forms of finders have been devised; one of the most common involves the use of a slide with horizontal and vertical scales, adjusted in connection with the mechanical stage.

**object-glass** (ob-jekt-glās), *n.* In a telescope or microscope, the lens which first receives the rays of light coming directly from the object, and collects them into a focus, where they form an image which is viewed through the eyepiece. In the finest refracting telescopes the object-glass consists of an achromatic combination of lenses, formed of substances having different dispersive powers, and of such figures that the aberration of the one may be corrected by that of the other. Ordinarily the combination consists of a convex lens of crown-glass and a concave lens of flint-glass, having focal lengths proportional to their dispersive powers. There are many different forms which fulfil the condition indicated, but vary in the curves of the lenses, their thickness, their relative position, and the distance between them. With the ordinary crown- and flint-glass it is not possible to obtain perfect achromatism; with the new kinds of glass made at Jena a much more perfect correction is possible, and it is likely that as a result telescopes will soon be greatly improved, provided the glass can be made in pieces of sufficient size and satisfactorily homogeneous. See *objective*, n., 3, and cuts under *microscope*.

**objectification** (ob-jek'ti-fi-kā'shon), *n.* [*< objectify + -ation (see -fication).*] The act or process of objectifying or of making objective. Also *objectivation*.

**objectivation** (ob-jek-ti-vä-'shon), *n.* [*< objectivate + -ion.*] Same as *objectification*.

**objective** (ob-jek-'tiv), *a. and n.* [= *F. objectif* = *Sp. objetivo* = *Pg. objetivo* = *It. obiettivo, obiettivo*, < *ML. objectivus*, relating to an object, < *objectum*, an object: see *object*, *n.* Cf. *subjective*.] 1. *a.* 1†. As perceived or thought; intentional; ideal; representative; phenomenal; opposed to *subjective* or *formal*—that is, as in its own nature. [This, the original meaning which the Latin word received from Duns Scotus, about 1300, almost the precise contrary of that now most usual, continued the only one till the middle of the seventeenth century, and was the most familiar in English until the latter part of the eighteenth.]

Natural phenomena are only natural appearances. They are, therefore, such as we see and perceive them. Their real and *objective* natures are therefore the same. *Berkley*.

The faculty of the imagination, for example, and its acts were said to have a subjective existence in the mind; while its several images or representations had, qua images or objects of consciousness, only an *objective*. Again, a material thing, say a horse, qua existing, was said to have a subjective being out of the mind; qua conceived or known, it was said to have an *objective* being in the mind.

*Sir W. Hamilton*, in Reid's Supplementary Dissertations, [note B., § 1.

Where or when should we be ever able to search out all the vast treasures of *objective* knowledge that layes within the compass of the universe?

*Sir M. Hale*, *Orig. of Mankind*, p. 156.

[By *objective* knowledge was meant the propositions known, opposed to *formal* or *subjective* knowledge, the act or habit of knowing. Such expressions probably led to the change of meaning of the word.]

2. Pertaining or due to the real object of cognition; real; opposed to *subjective* (pertaining or due to the subject of cognition, namely, the mind). [This meaning of the word nearly reverses the original usage; yet if such passages as that from Sir M. Hale, above, on the one hand, and that from Watts, below, on the other, be compared, the transition will be seen to have been easy. Kant makes the objects of experience to be at once real and phenomenal; and what he generally means by the *objective* character of a proposition is the force which it derives from the thing itself compelling the mind, after examination, to accept it. But occasionally Kant uses *objective* to imply a reference to the unknowable thing-in-itself to which the compelling force of phenomena is due.]

*Objective* certainty is when the proposition is certainly true in itself; and subjective when we are certain of the truth of it. The one is in things, the other is in our minds.

*Watts, Logic*, ii. 2, § 8.

[Thus, there is an *objective* certainty in things that any given man will die; and a *subjective* certainty in his mind of that *objective* certainty.]

*Objective* means that which belongs to, or proceeds from, the object known, and not from the subject knowing, and thus denotes what is real, in opposition to what is ideal—what exists in nature, in contrast to what exists merely in the thought of the individual.

*Sir W. Hamilton*, *Metaph.*, ix.

A form of consciousness, which we cannot explain as of natural origin, is necessary to our conceiving an order of nature, an *objective* world of fact from which illusion may be distinguished.

*T. H. Green*, *Prolegomena to Ethics*, § 19.

If an exact *objective* measurement of the physical stimuli is intrinsically difficult, an exact subjective measurement of the sensations themselves is inherently impossible.

*G. T. Ladd*, *Physiol. Psychology*, p. 361.

The number of vibrations is the *objective* characteristic of that which we perceive subjectively as colour.

*Lommel*, *Light* (trans.), p. 226.

3. Substantive; self-existent. [This rather confusing use of the word belongs to writers of strong nominalistic tendencies.]

Science . . . agrees with common sense in demanding a belief in real *objective* bodies, really known as causes of the various phenomena the laws and interrelations of which it investigates. *Mivart, Nature and Thought*, p. 89.

The only other thing in the physical universe which is conserved in the same sense as matter is conserved, is energy. Hence we naturally consider energy as the other *objective* reality in the physical universe.

*Tait*, in *Encyc. Brit.*, XV. 747.

4. Intent, as a person, upon external objects of thought, whether things or persons, and not watching one's self and one's ways, nor attending to one's own sensations; setting forth, as a writing or work of art, external facts or imaginations of such matters as they exist or are supposed to exist, without drawing attention to the author's emotions, reflections, and personality.

The only healthful activity of the mind is an *objective* activity, in which there is as little brooding over self as possible.

*J. Fiske*, *Cosmic Philos.*, I. 142.

The two epics [the *Iliad* and *Odyssey*] appear on the horizon of time so purely *objective* that they seem projected into this visible diurnal sphere with hardly a subjective trace adhering to them, and are silent as the stars concerning their own genesis and mutual relation.

*W. D. Howells*, *Problem of the Homeric Poems*, ii.

The theme of his [Dante's] poem is purely subjective, modern, what is called romantic; but its treatment is *objective* (almost to realism, here and there), and it is limited by a form of classic severity.

*Lowell*, *Among my Books*, 2d ser., p. 37.

5. In *gram.*, pertaining to or noting the object of a transitive verb, or of a preposition; forming or expressing a grammatical object: as, the *objective* case; an *objective* phrase or clause. Abbreviated *obj.*—**Objective abstraction, beatitude, being, doubt.** See the nouns.—**Objective cause**, the external object which excites the principal cause of any effect to action; the procatartical cause.—**Objective concept**, a concept conceived as constituting a real likeness among the objects which come under it: opposed to a *formal concept*, or the concept regarded merely as a function of thought.—**Objective end, ens, evidence, idealism, etc.** See the nouns.—**Objective line**, in *persp.*, any line drawn on the geometrical plane the representation of which is sought in the draft or picture.—**Objective logic**, the logic of objective thought; the general account of the process by which the interaction of ideal elements constitutes the world. *Hegel*.—**Objective method**, the inductive method: the method of modern science.—**Objective philosophy.** Same as *transcendental philosophy* (which see, under *philosophy*).—**Objective plane**, any plane, situated in the horizontal plane, whose perspective representation is required.—**Objective point.**—(a) The point or locality aimed at: the final or ultimate point to which or to reach which one's efforts or desires are directed; specifically (*anilat.*), the point toward securing which a general directs his operations, expecting thereby to obtain some decisive result or advantage. Hence—(b) The ultimate end or aim; that toward the attainment of which effort, strategy, etc., are directed.—**Objective power or potency**, that of a consistent object of thought; logical possibility: non-existence combined with non-repugnance to existence.—**Objective reality**, the reference of a concept to an object.—**Objective reason or thought**, in *metaph.*, reason or thought as existing not in the individual mind, but as in the real objects of cognition.

A truly *objective thought*, far from being merely ours, must at the same time be what we have to discover in things, and in every object of perception.

*Hegel*, tr. by Wallace, *Logic of the Encyclopedia*, § 41.

**Objective symptoms**, in *med.*, symptoms which can be observed by the physician, as distinct from *subjective symptoms*, such as pain, which can be directly observed only by the patient.—**Objective truth**, the agreement of a judgment with reality: material truth.—**Objective validity**, applicability to the matter of sensation.

There therefore arises here a difficulty which we did not meet with in the field of sensibility, namely how subjective conditions of thought can have *objective validity*—that is, become conditions of the possibility of the knowledge of objects.

*Kant*, *Critique of Pure Reason* (tr. by Max Muller, orig. [ed.], p. 89).

II. *n.* 1. In *Eug. gram.*, the objective case; the case used to express the object of a verb or a preposition. This case answers in most of its uses to the accusative of Greek, Latin, German, and other languages, and is sometimes so called in English. In nouns it is never distinct in form from the subjective or nominative; the only objectives having such a distinct form are the pronominal case-forms *me, thee, him, her, us, them, whom*, corresponding to the nominatives *I, thou, he, she, we, they, who* respectively. Of these, *her* happens to be the same in form as the possessive. When words expressing extent in space or duration in time are put in the objective, they are called *adverbial objectives*: as, he ran a mile; she sang an hour. Compare *cognate object*, under *object*, 5. Abbreviated *obj.*

2. An objective point; especially, the object, point, or place to or toward which a military force is directing its march or its operations.

In 1864 the main *objectives* were Lee's and Johnston's armies, and the critical point was thought to be Richmond or Atlanta, whichever should be longest held.

*The Century*, XXXV. 505.

3. The lens, or practically the combination of lenses, which forms the object-glass of an optical instrument, more particularly of the microscope (see *object-glass*). Objectives are generally named from the focal length of a single lens which would have the same magnifying power: as, a two-inch objective or power, a one-half-inch objective (or simply a half), etc. Objectives of high magnifying power and consequently short nominal focal length (e. g., less than half an inch) are often spoken of as *high powers*, in distinction from the *low powers*, which magnify less and have longer nominal focal lengths. Objectives are also characterized as *immersion-objectives* or *dry objectives* according as they are used with or without a drop of liquid between the lens

and the object; if the liquid has sensibly the same refractive power as the glass of the lens, the system is called *homogeneous immersion*. (See *immersion*, 3.) The properties of an objective which determine its value for practical work are—*definition* or defining power, depending upon its freedom from spherical and chromatic aberration, which should be accompanied by flatness of field; *aperture*, the power of bringing parts of the object at different levels into focus at once; *resolving power*, the ability depending upon the size of the aperture and the definition to exhibit the minute details of structure, as the lines on a diatom frustule (see *test-object*); *working distance*, which is the space separating the lens and the object when the latter is in focus. These properties are in some degree antagonistic: thus, an increase in the aperture, and hence of the resolving power, is accompanied by a decrease in the working distance. The aperture of an objective is often measured by the angle of the cone of rays which it admits, and is then called *angular aperture*. Since, however, this angle varies according as it is used as a dry, water-immersion, or homogeneous immersion objective, a common measure is obtained, as proposed by Abbe, by taking the product of the half-angle into the refractive index of the medium employed: this is called the *numerical aperture* (sometimes written *N. A.*). Thus, for the maximum air-angle of 180°, which is equivalent to a water-angle of 97° 31' and a balsam-angle of 82° 17', the numerical aperture is unity, while for the respective angles of 60° (air), 44° 10' (water), 38° 24' (balsam), it is 0.5. Again, a numerical aperture of 1.33 corresponds to the maximum water-angle of 180° and a balsam-angle of 122° 6'.—**Endomersion-objective**, a form of objective, or objective-glass, devised by Zenger, in which the chromatic aberration is removed by the employment of a liquid (as a mixture of ethereal and fatty oils) placed between the separate lenses.

See *objective*, *a.*

The Greek philosophers alone found little want of a term precisely to express the abstract notion of *objectivity* in its indeterminate universality, which they could apply, as they required it, in any determinate relation.

*Sir W. Hamilton* (in Reid), *Supplementary Dissertations*, [note B., i.

*E. Caird*, *Philos. of Kant*, p. 198.

Intense *objectivity* of regards, as in a race or an engrossing operation, is not, strictly speaking, unconsciousness, but it is the maximum of energy with the minimum of consciousness.

Such communities are the *oblatus* founded by St. Francesca of Rome about 1433, and the *Oblate Sisters of Providence*, a sisterhood of colored women founded at Baltimore in 1825 for the education and the amelioration of the condition of colored women.

2. *Eccles.*, a loaf of unconsecrated bread prepared for use at the celebration of the eucharist; altar-bread. From the earliest times of which we have distinct information, *oblatus* have been circular in form, of moderate thickness, and marked with a cross or crosses. In the Western Church they are unleavened, much reduced in size, and commonly known as *wafers*, or, especially after consecration, as *hosts*. In the Anglican Church the use of leavened bread in loaves of ordinary size and form was permitted at the Reformation, and became the prevalent though not exclusive use. The Greek Church uses a circular *oblatus* of leavened bread, in the center of which is a square projection called the *Holy Lamb*. This projecting part alone is consecrated, and the remainder serves for the antidoron.—**Oblate roll**, in *Eng. hist.*, the account kept in the exchequer, particularly in the reigns of John and Henry III., of old debts due to the king and of gifts made to him.

The act of offering. Specifically, *eccles.*: (a) The donation by the laity of bread and wine for the eucharist, and of other gifts or of contributions in money for the maintenance of divine worship and for the support of the clergy and the poor. In the early church the bread and wine were given by members of the congregation to the deacon before the liturgy, and offered by the priest on the altar; later this custom fell into disuse, and the other gifts were presented at or just before the offertory. The Greek church has a special preparation of the elements in the office of prothesis (see *prothesis*), before the liturgy. (b) The offering or presenting to God upon the altar of the unconsecrated bread and wine; the offertory. (c) The solemn offering or presentation in memorial before God of the consecrated elements as sacramentally the body and blood of Christ. This is called the *great oblation*, in distinction from the *lesser oblation* or offertory. The great oblation forms the second part of the prayer of consecration, the first part being the words of institution, or the consecration in the stricter sense. In the Oriental liturgies, in the Scotch communion office of 1764, and in the American Book of Common Prayer, the great oblation is succeeded by the invocation or epiclesis.

The earliest theory of Liturgies recognized three distinct *Oblations* in the Holy Action.

**Act of Oblivion,** an English statute of 1660, entitled "An Act of Free and Generall Pardon, Indemnity, and Oblivion," by which all political offenses committed during the time of the Commonwealth were pardoned, excepting by name certain persons, chief of whom were those engaged in the sentence and execution of Charles I. Also called *Act of Indemnity*. = *Syn. Oblivion, Forgetfulness*.

**Obliviousness.** *Oblivion* is the state into which a thing passes when it is thoroughly and finally forgotten. The use of *oblivion* for the act of forgetting was an innovation of the Latinizing age, which has not won recognition, nor has the "Act of Oblivion" given *oblivion* currency in the sense of official or formal pardon. *Forgetfulness* is a quality of a person; as, a man remarkable for his *forgetfulness*. If *forgetfulness* is ever properly used where *oblivion* would serve, it still seems the act of a person; as, to be *lulled in forgetfulness*. *Obliviousness* stands for a sort of negative act, a complete failure to remember; as, a person's *obliviousness* of the proprieties of an occasion.

**oblivionize†** (ob-liv'ē-on-iz), *v. t.* [*< oblivion + -ize.*] To commit to oblivion; discard from memory; forget.

An important musical instrument of the wood wind group, and the type of the family in which the tone is produced by a double reed. In its modern form it consists of a wooden tube of conical bore, made of three joints, the lowest of which is slightly flaring or belled, while the uppermost carries in its end the metal staple with its reeds of cane. The number of finger-holes varies considerably; in the larger varieties they are principally controlled by an intricate system of levers. The extreme compass is nearly three octaves, upward from the B<sub>3</sub> or B<sub>2</sub> next below middle C, including all the semitones. The tone is small, but highly individual and penetrating; it is especially useful for pastoral effects, for plaintive and wailing phrases, and for giving a ready quality to concerted passages. The normal key (tonality) of the orchestral oboe is C, and music for it is written with the G clef. The oboe has borne various names, such as *chautman*, *schalmei*, *shawm*, *bombardo piccolo*, *hautboy*, etc. It has been a regular constituent of the modern orchestra since early in the eighteenth century, and is the instrument usually chosen to give the pitch to others. It has also been used to some extent as a solo instrument. The oboe family of instruments includes the oboe d'amour, the oboe da caccia or tenoroon, the English horn, and the bassoon.

2. In *organ-building*, a reed-stop with metal pipes which give a penetrating and usually very effective oboe-like tone. It is usually placed in the swell organ.—**Oboe d'amour**, an obsolete alto oboe, much used by J. S. Bach. It differed from the modern oboe in being of lower pitch (the normal key being A), and in having a globular bell and thus a more sonorous and muffled tone. **Oboe da caccia**, an obsolete tenor oboe, or rather tenor bassoon. Its normal key was F. The tone was similar to that of the bassoon, but lighter. Also called *tenoroon* and *trap-tine*.

In those sciences which describe and explain provinces of the universe as it exists, such as astronomy and systematic biology, observations are, for the most part, made under circumstances or conditions which may be selected, but cannot be produced at will. But in those sciences which analyze the behavior of substances under various conditions it is customary first to place the object to be examined under artificially produced conditions, and then to make an observation upon it. This whole performance, of which the observation is a part, is called an *experiment*. Formerly sciences were divided into sciences of experiment and sciences of observation, meaning observation without experiment. But now experiments are made in all sciences. It is only occasionally that the word *observation* has been used to imply the absence of experimentation.

Generally the first expresses something arising from the nature and circumstances of the affair; the second something arising from a foreign cause. An obstruction blocks the passage, and is generally put in the way intentionally. An impediment literally clogs the feet and so may continue with one, hindering his progress, while a difficulty once overcome, an obstacle once surmounted, or an obstruction once broken down, leaves one free to go forward without hindrance.

=**Syn.** 1. *Obstinate*, *Stubborn*, *Intractable*, *Refractory*, *Contumacious*, pertinacious, headstrong, unyielding, dogged, wilful, persistent, immovable, inflexible, firm, resolute. The first five words now imply a strong and vicious or disobedient refusal to yield, a resolute or unmanageable standing upon one's own will. *Stubborn* is strictly negative: a *stubborn* child will not listen to advice or commands, but perhaps has no definite purpose of his own. *Obstinate* is active: the *obstinate* man will carry out his intention in spite of advice, remonstrance, appeals, or force. The last three of the italicized words imply disobedience to proper authority. *Intractable*, literally not to be drawn, handled, or governed, is negative; so is *refractory*; both suggest sullenness or perverseness; *refractory* is more appropriate where resistance is physical: hence the extension of the word to apply to metals. *Contumacious* combines pride, haughtiness, or insolence with disobedience; in law it means wilfully disobedient to the orders of a court.

He was a great advocate of the rule of poverty of the Franciscan order, to which he belonged, and a strong defender of the state against the pretensions of the papacy. All his teachings depend upon the logical doctrine that generality belongs only to the significations of signs (such as words). The conceptions of the mind are, according to him, objects in themselves individual, but naturally significative of classes. These principles are carried into every department of logic, metaphysics, and theology, where their general result is that nothing can be discovered by reason, but all must rest upon faith. Occamism thus prepared the way for the overthrow of scholasticism, by arguing that little of importance to man could be learned by scholastic methods; yet the Occamist writings exhibit the scholastic faults of triviality, prolixity, and formality in a higher degree than those of any other school.

At that time [about 1840] the literary society of Moscow was divided into two hostile camps—the Slavophiles and the Occidentalists. Ginger is the root . . . of an herbaceous plant . . . very common in many parts of India, growing either from root or seed, which in December and January they take up, and, gently dried, roll it up in earth; whereby, *occluding* the pores, they conserve the natural humidity, and so prevent corruption. *Sir T. Browne, Vulg. Err.*, ii, 6.

**2.** In *physics* and *chem.*, to absorb; specifically applied to the absorption of a gas by a metal, such as iron, platinum, or palladium, particularly at a high temperature. Thus, palladium heated to redness and cooled in a current of hydrogen absorbs or *occludes* over 900 times its volume of the gas. By this means the physical properties of the metal are changed, and the occluded hydrogen is regarded as existing in a solid form as a quasi-metal, called *hydrogenium*, the specific heat, specific gravity, and electrical conductivity of which have been approximately determined. Probably a part of the gas forms also a definite chemical compound with the metal. Occluded gases also occur in meteorites. Thus, the Arva meteoric iron yielded (Wright) 47 volumes of the mixed gases carbon dioxide, carbon monoxide, hydrogen, and nitrogen.

Professor Graham has shown its [palladium's] remarkable power of absorbing hydrogen. When a strip of palladium is made the negative electrode in an apparatus for decomposing water, it absorbs 500 or 600 times its volume of hydrogen, expanding perceptibly during the absorption. This *occluded* gas is again given off when the substance, which Professor Graham believed to be an actual alloy of palladium and hydrogen, is heated to redness. *Madan*.

Not apparent upon mere inspection, nor deducible from what is so apparent, but discoverable only by experimentation; relating to what is thus undiscoversable by mere inspection; opposed to *manifest*. The Latin word was applied in the middle ages to the physical sciences and the properties of bodies to which those sciences relate. Its precise meaning is explained in the treatise "De Magnete" of Petrus Peregrinus. He says that an *occult* quality is simply one which is made apparent only upon experimentation, but that in that way it becomes as plain and clear as any other quality, and is no more mysterious. By *occult science* or *philosophy* was meant simply experimental science. There were many occult philosophers in northern Europe in the twelfth and the first part of the thirteenth century; but theology so swallowed up other interests that they are all forgotten except Roger Bacon, who was made prominent by the personal friendship of a pope. The ignorance and superstition of the time confounded occult science with magic.

These are manifest qualities, and their causes only are occult. *Newton*, Opticks.

His [Dr. Dee's] personal history may serve as a canvas for the picture of an occult philosopher—his leivities, his ambition, and his calamity.

*I. D'Israeli*, Amen, of Lit., II, 286.

See *crime*.—**Occult diseases**, in *med.*, those diseases the cause and treatment of which are not understood.—**Occult lines**, such lines as are used in the construction of a drawing, but do not appear in the finished work; also, dotted lines.—**Occult qualities**, those qualities of body or spirit which baffled the investigation of the ancient philosophers, and which were not deducible from manifest qualities, nor discoverable without experimentation.

The Aristotelians gave the name of *occult qualities* . . . to such qualities only as they supposed to lie hid in bodies, and to be the unknown causes of manifest effects.

*Newton*, Opticks (ed. 1721), p. 377.

**Occult sciences**, the physical sciences of the middle ages; sometimes extended to include magic. See def. 1. = *Syn. Latent*, *Covert*, etc. (see *secret*), unveiled, recondite, abstruse, veiled, shrouded, mystic, cabalistic.

The act of hiding or concealing; or the state of being hidden or concealed; especially, the hiding of one body from sight by another; specifically, in *astron.*, the hiding of a star or

**occupancy** (ok'ŭ-pān-si), *n.* [*< occupan*(t) + *-cy*.] 1. The act of taking possession, or the being in actual possession; more specifically, in *law*, the taking possession of a thing not belonging to any person, and the right acquired by such act; that mode of acquiring property which is founded on the principle that he who takes possession of an ownerless thing, with the design of appropriating it to himself, thereby becomes the owner of it; the act of occupying or holding in actual as distinguished from constructive possession. Formerly, when a man held land *pur autre vie* (for the life of another), and died before that other, as his estate could not descend to his heir nor revert to the donor until the determination of the specified life, it was considered to belong of right to the first who took possession of it for the remainder of the life, and such possession was termed *general occupancy*. And when the gift was to one and his heirs for the life of another, the heir was said to take as *special occupant*. As the law now stands, however, a man is enabled to devise lands held by him *pur autre vie*, and if no such devise be made, and there be no special occupant, it goes to his executors or administrators.

As we before observed that *occupancy* gave the right to the temporary use of the soil, so it is agreed upon all hands that *occupancy* gave also the original right to the permanent property in the substance of the earth itself; which excludes every one else but the owner from the use of it. *Blackstone*, Com., II, i.

2. The term during which one is an occupant; as, during his *occupancy* of the post.

2. More specifically, in *law*, one who first takes possession of that which has no legal owner.—3*rd*. A prostitute.

3. *Occupation*, *Calling*, *Vocation*, *Employment*, *Pursuit*, *Business*, *Trade*, *Craft*, *Profession*, *Office*. In regard to what a person does as a regular work or a means of earning a livelihood, *occupation* is that which occupies or takes up his time, strength, and thought; *calling* and *vocation* are high words, indicating that one is called by Providence to a particular line of work; *calling* is Anglo-Saxon and familiar, and *vocation* is Latin and lofty (the words are not always used in the higher sense of divine appointment or the call of duty, but it is much better to save them for the expression of that idea); *employment* is essentially the same as *occupation*; *pursuit* is the line of work which one pursues or follows; *business* suggests something of the management of buying and selling; *trade* and *profession* stand over against each other for the less and more intellectual pursuits, as the *trade* of a carpenter, the *profession* of an architect; *trade* is different from a *trade*, the latter being skill in some handicraft; as, being obliged to learn a *trade*, he chose that of a blacksmith; the "learned *professions*" used to be law, medicine, and the ministry, but the number is now increased; *craft* is an old word for a *trade*; *office* suggests the idea of duties to be performed for others. **ocean** (ō'shan), *n.* and *a.* [*< ME. ocean, ocean, ocean, ocean, < OF. ocean, ocean, ocean, ocean, < F. océan = Sp. océano = Pg. oceano = It. oceano = D. oceaan = G. Sw. Dan. ocean, < L. oceanus, the ocean, < Gr. Ὠκεανός, orig. (in Homer) the great stream supposed to encompass the earth (also called by Homer Ὠκεανὸς ποταμός, or ὄρεος, 'Ocean-stream' (Milton); also personified, Oceanus, the god of the primeval waters; later, the great outward sea, the Atlantic, as distinguished from the inward sea, the Mediterranean; perhaps orig. 'swift,' < ὠκίς, swift.)* **I. n.** 1. The body of water which envelops the earth, and covers almost three fourths of its surface with a mean depth — as nearly as can be estimated at the present time — of less than 12,500 feet. Physical geographers, following the lead of the Royal Geographical Society, generally divide the entire oceanic area into five distinct oceans, namely the Arctic, Antarctic, Atlantic, Pacific, and Indian; but these divisions are largely artificial, the lines by which they are indicated being in no small part parallels and meridians. The Arctic and Antarctic oceans, according to this scheme, extend from the north and south poles respectively to the arctic and antarctic circles. The Atlantic extends between the two polar circles, being limited on the east by the land-masses of Europe and Africa and by the meridian extending from Cape Agulhas to the antarctic circle, and on the west by the American land-mass and the meridian of Cape Horn. The Pacific has as its land-limits on the east the American coast, and on the west the Asiatic land-mass, the Philippine Islands, New Guinea, and Australia; its imaginary limits are the meridians of Cape Horn and the South Cape of Tasmania prolonged to meet the antarctic circle. The Indian ocean extends south from the Asiatic mainland to the antarctic circle, its eastern and western imaginary limits having been already given in defining those of the Pacific and Atlantic. Thus, as will be noticed, there are no natural limits on the south of either the Atlantic, the Pacific, or the Indian ocean, since these all unite with the Antarctic ocean to form one continuous area of water. Hence it would be more philosophical to call the vast area of water occupying the chief part of the southern hemisphere the Southern ocean, as has been done by Herschel and Thomson, and to consider the Atlantic, Pacific, and Indian oceans as immense gulfs or prolongations toward the north of the still greater Southern ocean. The Pacific ocean was most generally designated by the older English navigators as the "South Sea," and this name is still current among the Germans. The Atlantic and Pacific are also generally divided into North and South Atlantic and North and South Pacific by the equatorial line. The smaller divisions of the ocean are, in the order of their respective magnitudes, seas, gulfs, bays, sounds, straits, coves, holes, and harbors (see each of these words). The mean depth of the ocean is probably not far from six times the mean elevation of the land above the ocean-level. The deepest soundings of the ocean, however, give figures a little inferior in amount to those indicating the elevation of the very highest mountain-summits. In several different parts of the ocean depths of over 26,000 feet have been sounded, but nowhere as yet has a depth as great as 29,000 feet (the height of Gaurisankar) been reached. (See *deep-sea sounding-machine*, under *deep-sea*.) The oceanic currents are of great importance in their effect on climate. The principal surface current is the equatorial, due to the action of the trade-winds, by which the water is continually urged westward, but, being driven in its westerly course against the land-masses, it is deflected by them, and forced to perform an immense gyration by which it returns into the general system far to the eastward. Owing to the shape of the land-masses in the northern hemisphere, these modifications of the equatorial current are much more distinct and important than they are to the south of the equator. Two of the oceanic currents are especially interesting, the Gulf Stream of the Atlantic and the Kuroshio of the Pacific (see these terms). The surface temperature of the ocean varies greatly in the different latitudes and with the strength and direction of the surface currents, the Gulf Stream playing a most important part in ameliorating the climate of northwestern Europe by means of the heated surface water which it carries from the equatorial regions. Besides these surface currents, however, there is a general exchange of water always going on in the depths of the ocean between the warmer equatorial and the colder polar waters, brought about by the dif-

ference in specific gravity of the two. As the result of this, it is found that the temperature of the ocean as a rule diminishes as greater depths are attained, and that the deeper parts, where open to the general circulation, are near the freezing point. A remarkable feature of the ocean-water is the uniformity in the nature and quality of the salts which it contains, provided the specimen has been taken at considerable distance from land. The weight of the salts held in solution by the main ocean is about 3 per cent. of the whole; of this about three quarters is common salt, one tenth chlorid of magnesium, one twentieth sulphate of magnesia, about the same sulphate of lime, one twenty-fifth chlorid of potassium, and a little over one per cent. bromide of sodium. Other substances are also present in smaller quantity, making in all about twenty-nine elements which have been detected in the ocean-water; many of these, however, exist only in very minute traces. The economical value of the ocean as a source of supply for common salt is considerable; but the quantity thus obtained is not so great as that furnished by mines of rock-salt or by the evaporation of brine got by boring. See salt.

This structure is most characteristically developed in the leucophytes. Also called *centric structure* by some English lithologists, by whom this term is used rather vaguely, sometimes as nearly the equivalent of *microphyllite*.

The structures which especially distinguish these granophytic rocks are the microphyllite, the centric or *ocellar structure*, the pseudospherulitic, the micropagitic, and the drusy or microlitic structures.

class of natural earths consisting of mixtures of the hydrated sesquioxides of iron with various earthy materials, principally silica and alumina. These mixtures occur in many localities and have many shades of color, among which tints of red, reddish brown, yellow, and orange are most common. They form a series of valuable and important pigments, used extensively alike by house-painters and artists both in oil and in water-colors. The most usual and common type of ocher-color is a yellow turning neither to red on the one hand nor to brown on the other, but its tone is not as brilliant nor as pure as chrome-yellow. (For varieties see below.) Ochres in general have much body and are very permanent. Most ochres on burning become redder and darker. Raw sienna and raw umber are varieties of ocher. 2. The average number of days in the year was thus made up to 365. In most states, the intercalary month took the name of the sixth month, which it followed, being distinguished from this by the epithet *second*. 2. In music: (a) A tone on the eighth diatonic degree above or below a given tone; the next higher or lower replicate of a given tone. (b) The interval between any tone and a tone on the eighth degree above or below it. (c) The harmonic combination of two tones at the interval thus described. (d) In a scale, the eighth tone from the bottom, or, more exactly, the tone with which the repetition of the scale begins; the upper key-note or tonic; the eighth: solmized *do*, like the lower key-note. The typical interval of an octave is that between any tone and its next replicate, which is acoustically represented by the ratio 1:2—that is, in number of vibrations—and is equal to six diatonic whole steps or to twelve semitones. Such an octave is called *perfect* or *major*; an octave one half-step shorter is called *diminished* or *minor*; an octave one half-step longer is called *augmented*. The perfect octave is the most complete consonance after the unison. Indeed, its completeness is often regarded as belonging to a different category from that of the other perfect consonances, except the unison, since it amounts rather to a repetition or reinforcement of the original tone at a higher or lower pitch than to a combination of a new or different tone with it: hence the term *replicate*. In harmony the parallel motion of two voice-parts in perfect octaves is forbidden, except where the mere reinforcement of one voice by another is desired: such octaves are called *consecutive octaves*. *See consecutive intervals, under consecutive.* (c) In a standard system of tones selected for artistic use, a division or section or group of tones an octave long, the limits of which are fixed by reference to a given or assumed standard tone whose exact pitch may be defined. The tone usually assumed as a starting-point is *middle C* (written on the first ledger line below in the treble clef, and on the first above in the bass clef). The octave beginning on the next C below is called the *tenor* or *small octave*; that beginning on the second C below is called the *bass* or *great octave*; that beginning on the third C below is called the *contrabass octave*; while that beginning on middle C itself is called the *alto*, *once-marked*, or *once-accented octave*; that beginning on the next C above is called the *treble*, *twice-marked*, or *twice-accented octave*, etc. *See the accompanying table:*

The acceptance of the octave as the best unit for thus dividing the series of recognized tones into sections of equal length and value has not been uniform. Ancient Greek music seems to have first used the tetrachord as such a unit; while mediæval music employed the hexachord in the same way. The subdivision of the octave portions themselves has also varied greatly in different systems of music. *See scale.* (f) In organ-building, a stop whose pipes give tones an octave above the normal pitch of the digitals used; specifically, such a stop of the diapason variety. Also known as the *principal*. Also called *octave-flute*, *octave-stop*.—3. Any interval resembling the musical octave in having the vibration-ratio of 1:2.

If . . . the solar spectrum be considered in its whole extent, we find in the ultra red alone, according to Müller, more than two octaves, to which must be added more than another octave from A to the line R in the ultra-violet. The whole length of the solar spectrum thus embraces consequently about four octaves. *Lommel, Light (trans.), p. 281.*

**Covered or hidden octaves**, in music, the consecutive octaves that are suggested when two voices proceed in similar (not parallel) motion to a perfect octave. Hidden octaves are forbidden in strict counterpoint, and discountenanced in simple harmony, particularly if both voices skip. Compare *hidden fifths*, under *fifth*.—**Rule of the octave**, in the musical theory of the seventeenth and eighteenth centuries, an arbitrary and imperfect scheme of the harmonies proper to the successive tones of the scale. The modern theory that every tone of the scale may be made the basis of a triad has completely displaced this rule.—**Short octave**, in early organ-building, the lowest octave of the keyboard when made to consist of only three or four of the digitals most used in the music of the day, instead of the full number. The digitals were set close together, as if belonging to the regular series. This curtailment was simply to avoid the expense of large pipes.

II. *n.* A book or pamphlet every section or gathering of which contains eight leaves, each leaf supposed to be one eighth of the sheet printed: usually written *8vo*. When the name of the paper of which the book is made is not specified, an octavo is understood as a medium octavo, 6 × 9½ inches. Smaller octavos are—post 8vo, 5½ × 8½ inches; demy 8vo, 5½ × 8 inches; crown 8vo, 5 × 7½ inches; cap 8vo, 4½ × 7 inches. Larger octavos are—royal 8vo, 6½ × 10 inches; superroyal 8vo, 7 × 11 inches; imperial 8vo, 8½ × 11½ inches. These are regular octavo folds of established sizes of paper in the United States. Publishers and booksellers describe as octavos only those books or leaves that are larger than 5½ × 8 and smaller than 7½ × 11½ inches, irrespective of the number of leaves in a section, which may be twelve or sixteen on thin paper and four or six on thick paper. Larger sizes are described as 4to, smaller sizes as 12mo or 16mo. Bibliographers, as a rule, limit the use of the word *octavo* to books having sections of eight leaves or sixteen pages.

About 60 species are known, all parasitic in the larval state upon vertebrates. With a single exception this parasitism is confined to mammals. from a source or cause. Finally it transforms the idea of derivation or origin through several intermediate gradations of meaning into that of possessing or being possessed by, pertaining to or being connected with, in almost any relation of thought. Its partitive, possessive, and attributive uses are those which occur most frequently in modern English, especially when it connects two nouns. Generally speaking, it expresses the same relations which are expressed in Greek, Latin, German, Anglo-Saxon, and other languages by the genitive case, including many uses besides those of the English possessive.

It is often defined simply as a public charge or employment; but there are many instances of public charge or employment which are not in law deemed *offices*, such as the service of a janitor, or that of a person designated by special act to buy goods for public use. In early English law *office* was regarded as a right, and could be conferred on a man and his heirs. Specifically, a person holding a public office, under a national, state, or municipal government, and authorized thereby to exercise some specific function; as, an *officer* of the Treasury Department; a custom-house or excise *officer*; law *officers*; a court *officer*. In constitutional provisions and statutes regulating the appointment, tenure, emoluments, etc., of public officers the designations "officers," "civil officers," "public officers," "executive officers," "judicial officers," "legislative officers," "administrative officers," and the like commonly have in American law peculiar meanings dependent on the connection in which the phrases are used, and on other provisions of law necessary to be considered with them.

(c) A policeman, constable, or headle.

It is a strong wooden frame, from 16 to 20 feet square at the base, which is formed of heavy sills of oak or other suitable timber, and it tapers toward the top, which is from 60 to 75 feet above the sills. The corner parts are made of heavy pine planks, usually about 2 inches thick and 10 inches wide, spiked together at right angles, and bound to each other by cross-pieces and diagonal braces. A ladder is constructed on one side, extending from the bottom to a heavy cast-iron derrick-pulley supported in the upper part of the frame. The oil-derrick and its accessories are used

rigger, the oil slowly filtering through the pores. This has been followed by a variety of inventions, comprising oil-bags placed in water-closet pipes, and devices for distributing oil when towed by a vessel. The oil-distributor of M. Gaston Menier employs a pump discharging water at the water-line, through a series of outboard pipes, the pump also taking oil from a receptacle, and mingling it with the water discharged. The rate of expenditure of oil is indicated by a glass gage, and is regulated by a valve. The oil-distributor of Captain Townsend of the United States Signal Office consists of a hollow metal globe ten inches in diameter, which holds about 11 gallons of oil, and is kept afloat and held in a nearly fixed position relatively to the surface of the water by an air-chamber. The oil-chamber has an upper and a lower valve, both of which may be adjusted to permit water to flow in through the lower, and the oil displaced by the water to flow out through the upper valve, at a rate controlled by the adjustment. The oil acts mechanically by spreading over the surface of the sea in a tenuous film, which is sufficient to prevent the waves from breaking, and this takes from them their chief power for harm.

**oleomargarin, oleomargarine** (ô-lê-ô-mar'gâ-rin), *n.* [ < L. *oleum*, oil, + E. *margarin*.] A granular solid fat of a slightly yellowish color, obtained from the leaf-fat or calf-fat of cattle: so named by the inventor of the process of its preparation. The fat is first carefully cleaned from adhering impurities, as bits of flesh, etc., and then thor-

oughly washed in cold water. It is next rendered at a temperature of 130 to 175° F., and the mixture of oily products thus obtained is slowly and partially cooled, till a part of the stearin and palmitin has crystallized out. Under great hydraulic pressure the parts which still remain fluid are pressed out; after a time these solidify and are ready for market. This substance has been largely used as an adulterant of butter. When oleomargarin is churned in a liquid state with a certain proportion of fresh milk, a butter is produced which mixes with it, while the buttermilk imparts a flavor of fresh butter to the mass, making so perfect an imitation that it can scarcely be distinguished by taste from fresh butter. A refined fat strongly resembling that obtained from beef-fat is got from lard by similar treatment. Also, in commerce, called simply *oleo*.

It consists simply of a glass tube, one end of which curves upward, to be inserted into the nostril. A shorter movable cylinder, made of the odoriferous substance, fits over the straight end of this glass tube. On inhaling, no odor will be perceived so long as the outer does not project beyond the inner tube. The lobe is primitively hollow, being a tubular process whose cavity is continuous with that of the prosencephalic ventricle, and it is of much greater relative size in the lower than in the higher vertebrates. In the latter the olfactory lobes are reduced to a pair of solid flattened bands, like bits of tape, and improperly receive the name of *olfactory nerves*, which properly applies only to the numerous filaments arising from the bulbous end of the so-called olfactory nerves, penetrating the cribriform plate of the ethmoid bone through numerous minute foramina, and ramifying through the Schneiderian mucous membrane of the nose. above and silvery beneath; the general effect is that of an old willow. It is an evergreen, of great longevity and productiveness, and thrives in poor and dry calcareous and sandy soils. Of the cultivated variety (*O. sativa*) some twenty or thirty subvarieties are recognized. The wild variety (*O. oleaster*) has short blunt leaves, the branches more or less spiny, and a worthless fruit. It is native in southern Europe as well as Asia. The olive was anciently sacred to Pallas, and its leaves were used for victors' wreaths among the Greeks and Romans. (See *olive-branch*.) Thy wife shall be as the fruitful vine upon the walls of thine house, thy children like the *olive branches* ["olive-plants" in the authorized version] round about thy table. Ps. cxviii, 4, in Book of Common Prayer.

**olive-nut** (ol'iv-nut), *n.* The fruit of species of *Elaeocarpus*.

**olive-oil** (ol'iv-oil'), *n.* A fixed oil expressed from the pericarp or pulp of the common olive. It is an insipid, inodorous, pale-yellow or greenish-yellow, viscid fluid, unctuous to the feel, inflammable, incapable of combining with water, and nearly insoluble in alcohol. It is the lightest of all the fixed oils, and is of the non-drying class. It is very largely used as a food. In countries where it is produced it is employed in cookery and serves as butter with bread; in England and America its table use is chiefly that of a salad-dressing. In medicine it is employed principally in liniments, ointments, and plasters. Inferior grades serve for lubrication, illumination, wood-dressing, and soap-making. For the best oil the fruit should be picked just before it is ripe enough to fall, and ground at once. The first pressing, without application of water or heat, yields *virgin oil*. The second pressing, after subjecting the marc to the action of boiling water, is not quite so good; a third yields the inferior *percolated oil*. Olive-oil is extensively adulterated with cotton-seed, machis, and other oils. Italy leads in the production and export of olive-oil. Also called *swet-oil*.

*Bryant, The Ages, viii*

= **SYN.** *Omen, Portent, Sign, Presage, Prognostic, Augury, Foreboding.* *Omen* and *portent* are the most weighty and supernatural of these words. *Omen* and *sign* are likely to refer to that which is more immediate, the others to the more remote. *Omen* and *portent* are external; *presage* and *foreboding* are internal and subjective; the others are either internal or external. *Sign* is the most general. *Prognostic* applies to the prophesying of states of health or kinds of weather, and is the only one of these words that implies a

deduction of effect from the collation of causes. *Presage* and *augury* are generally favorable, *portent* and *foreboding* always unfavorable, the rest either favorable or unfavorable. *Omen* and *augury* are most suggestive of the ancient practice of consulting the gods through priests or augurs. A *foreboding* may be mistaken; the others are presumably correct. All these words have considerable freedom in figurative use. See *portent, v. t.*

**omen** (ô'men), *v.* [*< omen, n.* Cf. *ominally.*] **I.** *intrans.* To prognosticate as an omen; give indication of the future; augur; betoken.

**omentocele** (ô-men'tô-sël), *n.* [*< L. omentum, q. v., + Gr. κήλη, tumor.*] Hernia of the omentum; same as *epiplocele*.

**omentum** (ô-men'tum), *n.*; *pl. omenta* (-tä). [*L., adipose membrane, the membrane inclosing the bowels, etc.*] In *anat.*, a fold or duplication of peritoneum, of two or four peritoneal layers, passing between or hanging down from certain abdominal viscera—the stomach, liver, spleen, and colon. An omentum is a structure similar to a mesentery, and is in fact a special mesentery connecting the stomach with the liver, spleen, and colon respectively. Hence omenta are commonly distinguished by name. The *gastrohepatic* or *lesser omentum*, *omental minus*, is a single fold (two layers) of peritoneum extending between the transverse fissure of the liver and the lesser curvature of the stomach. Between the two layers are the hepatic artery, portal vein, bile-duct, and associate structures, bound together in a quantity of loose connective tissue forming Glisson's capsule. The *gastropleuric omentum*, of two layers, connects the concavity of the spleen with the fundus of the stomach, and contains the splenic vessels. The *gastrocolic* or *great omentum*, *omental majus*, also called *epiploon*, is the largest of all the peritoneal duplications, and consists of four layers of peritoneum attached to the greater curvature of the stomach and to the transverse colon, whence it is looped down freely upon the intestines, forming a great flap or apron.

This latter they call *Energia* of *ergon*, because it wrought with a strong and virtuous *operation*.  
*Pattenham*, *Arte of Eng. Poesie*, p. 119.

Freedom of operation we have by nature, but the ability of virtuous operation by grace.

Your serpent of Egypt is bred now of your mud by the operation of your sun; so is your crocodile.  
*Shak.*, *A. and C.*, ii. 7. 30.

2. A specific act or activity.

There are diversities of operations, but it is the same God which worketh all in all.

In the romance called *The Knight of the Swan*, it is said of Yvain duchess Emouly that she caused her three sons to be brought up in "all manner of good *operacions*, virtues, and manners."

Attention, though closely related to the active side of the mind and illustrating the laws of volition, is a general condition of our mental operations.

*J. Sully*, *Outlines of Psychol.*, p. 73.

3. The course of action or series of acts by which some result is accomplished; process. (*a*) In *surg.*, the act or series of acts and manipulations performed upon a patient's body, as in setting a bone, amputating a limb, extracting a tooth, etc.

While Gersdorff, of Strassburg, probably had used the ligature in amputation wounds for some years, it remained for the Germans of France to give to amputations a comparatively firm position among surgical operations.

*Buck's Handbook of Med. Sciences*, I. 142.

(*b*) In *math.*, the substitution of one quantity for another, or the act of passing from one to the other, the second quantity being definitely related to the first, either in value or in form. An operation must not be confounded with the process by which the operation is effected. Thus, there is but one operation of extracting the cube root of a number, but there are several different processes. (*c*) In *war*, the act of carrying out preconceived measures by regular movements: as, military or naval operations.

4. The state of being at work; active exercise of some specific function or office; systematic action; as, the machine is in operation.—5. Method of working; action.—6. Power exercised in producing an effect; peculiar efficacy of action; characteristic property or virtue.

*Babes Book* (E. E. T. S.), p. 206.

A good sherries-sack hath a two-fold operation in it.  
*Shak.*, *2 Hen. IV.*, iv. 3. 104.  
Something that hath the operation to  
Make death look lovely.

*Massinger*, *Renegado*, v. 6.

Not only the fabrication and false making of the whole of a written instrument, but a fraudulent insertion, alteration, or erasure, even of a letter, in any material part of a true instrument whereby a new operation is given to it, will amount to forgery—and this though it be afterwards executed by another person ignorant of the deceit.

*Russell*, *Crimes and Misdemeanors*, II. 619, quoted in *Encyc. Brit.*, IX. 413.

7. Impulse; tendency to act.

There are in men operations natural, rational, supernatural, some politick, some thally ecclesiastical.

(2) In *phanerogams*, sometimes, the lid or top of certain circumscissile capsules (pyxys), as in *Portulaca*, *Plantago*, etc. (3) The conical limb of the calyx of *Eucalyptus*. See cuts under *Ascidium* and *moss*. (b) In *zool.*: (1) In conchology, a horny or shelly plate secreted by the operculigerous organ of gastropods and some other mollusks, serving to close the aperture of the shell when the animal is retracted. See cuts under *Amphulariidae* and *Macluridae*. (2) In cirripeds, as *Balanus*, the movable part of the rigid shell, which forms a flap covering the entrance to the mantle-cavity. (3) In *Crustacea*, the eighth pair of appendages of a king-crab, united together into a single broad plate, on the dorsal surface of which the genital organs open, and which forms a flap covering the succeeding appendages of this division of the body. See *Linnæus*. (4) In *Polyzoa*, as *Chilostomata*, that part of the ectocyst of the cell of the polypid which forms a movable lid shutting down upon the zooid when the latter is withdrawn into its cell. (5) In *ichthyology*, the hindmost and uppermost bone of the opercular apparatus or gill-cover. See *opercular apparatus*, and also cuts under *palatoperculate*, *Spiridularia*, and *teleost*. (6) In *ornithology*: (a) The nasal scale; the small horny or membranous lid or flap which covers or closes the external nostrils of sundry birds. (b) The ear-conch or feathered flap which closes the ear of an owl. (7) In *mammalogy*, parts of the ear of an aquatic mammal, as a shrew or vole, so arranged as to act like a valve to prevent the entrance of water. (8) In *entomology*, one of two small pieces on the sides of the metathorax, covering the spiracles or breathing-orifices. Also called *fenestra* and *covering-scale*. (9) In *Arachnida*, one of the small scales covering the stigmata or breathing-orifices of a spider. They are distinguished as the *branchial opercula*, covering the openings of the branchiae, and the *tracheal opercula*, nearer the base of the abdomen or sometimes at the end, covering the orifices of the tracheae. The latter are often absent. (10) In *Infusoria*, the lid of the lorica, as of the *Forficulidae*. (c) In *overt*, of the brain, the principal covering of the insula or island of Reil, overlapping the gyri operi from above, and formed mainly by the precentral and postcentral gyri united below the end of the Rolandic or central fissure. (cf. *Opheolus*, serpent-slaying) < Gr. *ὄφις*, a serpent, + *βαλλω*, throw.] A large and beautiful genus of harmless serpents of the family *Colubridae*. There are numerous species in the United States, called *king snakes* and by other names, such as *O. getulus*, *O. sylv.*, and *O. erimius*. They are of various shades of black, brown, or red, blotched with lighter colors, the blotches generally black bordered.

**ophicalcite** (ōf-i-kāl'sit), *n.* [< Gr. *ὄφις*, a serpent, + E. *calcite*. Cf. *serpentine*, *n.*] Same as *verd-antique*. *Bronzart*.

The form is often slenderer than in a common eel; the posterior nostrils are labial—that is, are on the margin or even the inside of the upper lip; and the tongue is attached to the floor of the mouth. In some species the tail is conical or flukes; in others it is surrounded by a fin, as usual in eels, whence the two subfamilies *Ophichthyinae* and *Marinae*. Several genera are found in the waters of the southern and Pacific coasts of the United States.

**ophicleide** (ōf'ī-klid), *n.* [< Gr. *ὄφις*, a serpent, + *κλίε* (*κλίω*), a key; see *claris*.] A metal music wind-instrument, invented about 1790, having a large tube of conical bore, bent double, with a cupped mouth-piece.

It is essentially a development of the old wooden serpent, and has sometimes been made partly of wood; it is the bass representative of the keyed-bugle family. The tones produced are the harmonics of the tube, as in the horn; but the fundamental tone may be altered by means of keys which control vents in the side of the tube. Eleven such keys are employed, so that the entire compass is over three octaves, beginning (in the usual bass variety) on the third B below the middle C, with all the semitones—all obtainable with exceptional accuracy of intonation. Its resources are therefore considerable, and as its tone is highly resonant and pungent it is an important orchestral instrument. The alto ophicleide is pitched a fifth higher than that described above, while lower varieties also occur.

**ophicleidist** (ōf'ī-klid-ist), *n.* [< *ophicleide* + -ist.] A performer on the ophicleide.

Gr. *ὄφις*, serpent-necked), < *ὄφις*, a serpent, + *δέρμα*, Attic *derma*, neck, throat.] The typical genus of *Ophideridae*, having the palpi spatulate or clavate, and the hind wings luteous. It is very widely distributed in both hemispheres; the species are large and often beautifully colored. *O. fullonica* of South Africa damages

oranges by piercing them with its haustellum and sucking the juice.

**Ophideridae** (ōf-id'er'ī-dē), *n. pl.* [NL. (Günther, 1852), < *Ophideres* + -idae.] A family of noctuid moths of large size and striking coloration, represented by *Ophideres* and five other genera in nearly all faunas except the European.

**Ophidia** (ō-fid'ī-ā), *n. pl.* [NL., pl. of \**ophidium*, < Gr. *ὄφις*, dim. in form, but not in sense, of *ὄφις*, a serpent; or improp. for \**Ophionda*, < Gr. *ὄφις*, a serpent, + *ἰδα*, form.] An order of the class *Reptilia*, without developed limbs, but with mobile quadrate bone and separate mandibular rami; the snakes or serpents. The name was introduced to replace *Serpentes* of Linnaeus, and at first included not only serpents in a proper sense, but certain footless lizards, and even the amphibians of the family *Ceciliidae*. In *Ophidia* proper there is never any trace of fore limbs, and at most very rudimentary hind limbs, represented externally by mere and spurs or processes of the integument. There is no sternum. The ribs are very numerous, and are so arranged as to become indirect organs of locomotion by their action upon the skin and so on the scales of the belly. The vertebrae are procoelous, very numerous, not united in any sacrum, and bearing no chevron-bones. The skull has no quadratojugal arch nor parietal foramen; the lower jaw is articulated with a movable quadrate bone, and its rami are connected only by fibrous tissue. The bones of both jaws are generally freely movable, so that the mouth is enormously distensible. The tongue is slender, forked, and protrusile, subserving a tactile office. Teeth are present in one or both jaws, usually in both; they are numerous and sharp, and in venomous *Ophidia* some of the upper ones, usually a single pair, are enlarged, hooked, grooved, or apparently perforate, and thus converted into poison-fangs. The eyes have no movable lids, the cuticle extending directly over the eyeball. The cuticle is scaly, forming many very regularly arranged rows of scales on the upper parts, and usually larger modified scales on the under side, called *gastrorosteges* and *urosteges*, serving to some extent for locomotion. There is a pair of extracocular penes in the male; the female is oviparous or ovoviviparous. *Ophidia* are variously subdivided—by Duméril and Bibron into *Ophiderontia*, *Aglyptodontia*, *Proteroglypha*, and *Solenoglypha*, an arrangement substantially now current, though with some modifications. Cope's latest arrangement is *Epanodontia*, *Catodontia*, *Tortricina*, which are opoterodont, *Asinea*, which are aglyptodont, *Proteroglypha*, and *Solenoglypha*. There are 20 families and about 300 genera, of which more than 200 belong to the family *Colubridae* alone. See also cut under *Python*.

(1) In Bonaparte's early system the *Ophidiidae* embraced two subfamilies, *Ophidiina* and *Anomolyptini*. (2) In Günther's system they are a family of gadoid fishes corresponding to the modern *Ophidiidae*. (3) In Gill's system the family is restricted to those *Ophidiidae* which have the ventral fins under the chin, hind barbels, and the anus in the anterior half of the length of the fish, represented by four genera. See cut at *Ophidium*.

There is but one species, *O. paradoxum*, the snake-nut-tree, native in Guiana, a lofty tree bearing alternate pinnate leaves, panicles of many very small flowers, and roundish one-seeded drupes containing a spirally twisted snake-like embryo. The natives are said to believe that these are transformed into venomous serpents.

**Ophiocephalidae** (of i-ō-se-fal'i-dē), *n. pl.* [NL., < *Ophiocephalus* + -idae.] A family of fishes, typified by the genus *Ophiocephalus*; the walking-fishes. They have a long subcylindric body covered with small scales, and a snake-like head shielded on top with largescales, a long spinous dorsal fin, and usually six-rayed thoracic ventrals. These remarkable fishes breathe air by means of an air-chamber developed over the gills, and die if they breathe water too long. They live in holes in the banks of rivers and pools and similar wet places, and often burrow in the mud. There are 25 or 30 species, natives of the fresh waters of the East Indies and Africa, and some attain a length of from 2 to 4 feet. They are able to survive droughts, living in semi-fluid mud or lying torpid below the hard-baked crust of a tank or pool from which every drop of water has dried up. Respiration is probably suspended during this torpidity, but while the mud is still soft enough to let them come to the surface they rise at intervals to breathe air. This faculty of aerial respiration is due to the development of the accessory branchial chamber; there is, however, no accessory branchial organ, and the opening of the cavity is partly closed by a fold of mucous membrane.

**Ophiocephaloid** (of i-ō-sef'a-loid), *a. and n.* I. *a.* Resembling an ophiocephalus; belonging to the *Ophiocephalidae*, or having their characters.

The species are natives of the East. They are furnished with a cavity to supply water to the gills, and are able to live a long time out of water, and often travel considerable distances from one pool to another. The *O. rachua* (the *coramora* or *gachua* of India) is much used for food by the natives. It is generally brought to market and cut up for sale while living. Also, improperly, *Ophiocephalus*. Bloch and Schneider, 1801.

It is esteemed for the table, and is known by various names, as *bastard cod*, *cultas cod*, *green cod*, *buffalo cod*, and *cutfish*. See cut under *cultas cod*.

**Ophioglossaceae** (of i-ō-glo-sā'sē-ē), *n. pl.* [NL., < *Ophioglossum* + -aceae.] A small but very well-defined group of vascular cryptogamous plants, by some systematists regarded as an anomalous section of the ferns, by others considered as a group of equal taxonomic rank with the true *Filices*, the *Equisetaceae*, *Lycopodiaceae*, etc. The prothallium is formed of parenchymatous tissue, and is destitute of chlorophyll, being developed underground;

the leaves are not circinate in vernation, and the sporangia, which are endogenous in their origin and without annulus, are never borne on the under side of the green frond. They differ further from the true ferns by the absence or imperfect formation of bundle-sheaths and selenenchyma in the stems and leaves. The *Ophioglossaceae* embrace 3 genera, *Ophioglossum*, *Helminthostachys*, and *Botrychium*.

**Ophioglosseae** (of i-ō-glos'sē-ē), *n. pl.* [NL., < *Ophioglossum* + -ae.] Same as *Ophioglossaceae*.

The fronds are usually from a fleshy, sometimes bulbous root, and straight or inclined in vernation; the sporangia, which are endogenous in origin, cohere in one or more simple spikes, are naked, not reticulated, and destitute of a ring, and open by a transverse slit into two valves. For a single description of negro *ophiolatry* may be cited Bosman's description from Whydah in the Bight of Benin; here the highest order of deities were a kind of snakes which swarm in the villages, reigned over by that huge chief monster, uppermost and greatest and as it were the grandfather of all, who dwelt in his snake-house beneath a lofty tree, and there received the royal offerings of meat and drink, cattle and money and stuffs.

**Ophiophagus** (of i-ōf'ā-gus), *n.* [NL., < Gr. ὀφιοφάγος, serpent-eating; see *ophiophagous*.] A genus of very venomous serpents of the family *Elapidae*, or of the restricted family *Najidae*. It is a kind of cobra, very closely related to *Naja*, the chief technical distinction being the presence of postparietal plates on the head. *O. lapus*, the hamadryad, is one of the largest and most deadly of serpents; it is known to attain a length of nearly 12 feet, and is said to reach 15 feet. Its bite is fatal to man in a few moments, and it is said to be able to kill very large quadrupeds. This serpent is found in India and some of the East India islands, as Java, Sumatra, and Borneo, but is fortunately not so common as the ordinary cobra. The generic name refers to its habit of feeding upon other snakes.

They have the proth bone produced, only one suspensorium, the pelvic arch rudimentary or wanting, an external supraoccipital gonphosis, and an orbitospheno-oid. It includes 3 families of snake-like or worm-like lizards, inhabiting warm regions, the principal of which is the *Amphisbeneridae*. Also *Ophiosauri*, *Ophiosauria*.

**Ophiosauridae** (of 'i-ō-sā'ri-dē), *n. pl.* [*N.L.*, also *Ophiosauria*; < *Ophiosaurus* + *-idae*.] A family of serpentiform or ophiomorphic lacertilians, represented by the genus *Ophiosaurus*. They are generally called *glass-snakes*, from their fragility and their resemblance to snakes, there being no sign of limbs externally. See cut under *glass-snake*.

**Ophiosaurus** (of 'i-ō-sā'rus), *n.* [*N.L.*, < *Gr.* *ὄφις*, a serpent, + *σαῦρος*, a lizard.] A genus of lizards, representing the family *Ophiosauridae*; the glass-snakes. There is but one species, *O. ventralis*, common along the Atlantic coast of the United States from Virginia southward. It attains a length of from 1 to 3 feet, and is perfectly harmless and inoffensive. Also *Ophiours*. See cut under *glass-snake*.

**ophite**<sup>1</sup> (of 'it), *n.* [*Gr.* *ὄφις*, of or like a serpent, < *ὄφις*, a serpent.] Pertaining to a serpent.

**ophite**<sup>2</sup> (of 'it), *n.* [*L.* *ophites*, also *ophites*, serpentine stone (see *ophites*), < *Gr.* *ὄφις*, fem. *ὄφις*, of or like a serpent: see *ophite*<sup>1</sup>, *n.*] A name originally applied to certain eruptive (diabasic or doleritic) rocks occurring in the Pyrenees, and later used with similar meaning for rocks found in Spain, Portugal, and northern Africa. In many of these the angite has become converted into malite, hence they had previously been often classed with the diorites. Michel Lévy divides the French ophites into two types, the first distinguished by the presence of large proportions of the augitic or malitic constituent, the second by a large predominance of plagioclase. The composition of the rocks which have been designated by different lithologists as *ophites* is variable, and their relations have not yet been fully worked out.

**Ophite**<sup>2</sup> (of 'it), *n.* [*L.L.* *Ophite*, < *L.Gr.* *ὄφις* (also *ὄφιαρος*), pl., < *Gr.* *ὄφις*, of or pertaining to a serpent: see *ophite*<sup>1</sup>, *n.*] A member of a Gnostic body, of very early origin, especially prominent in the second century, and existing as late as the sixth century. Its members were so called because they held that the serpent by which Eve was tempted was the impersonation of divine wisdom, the great teacher and civilizer of the human race. They were also called *Naasenes* (from Hebrew *nachash*, a serpent). See *Sethian*.

**ophites** (ō-fī'tēz), *n.* [*L.*, < *Gr.* *ὄφις* (see *ῥόφις*), serpentine stone, so called, according to Pliny, because it is spotted like a snake, or, as was fancifully thought, because a person carrying it might walk among serpents with impunity: see *ophite*<sup>1</sup>.] A stone mentioned by various Greek and Latin authors, the word designating several quite different things. It is impossible to identify with certainty any one of the various substances, some of which were unquestionably fabulous, to which the name *ophites* was given by Ophreus, Dioscorides, Pliny, and other classic writers. Pliny distinguishes two kinds of ophite, the hard and the soft. The former may have been some variety of granite; the latter, a variety of serpentine, perhaps the Tuscan gabbro or ophiolite. From a very early time, various rounded stones or petrifications, more or less egg-shaped in form, and called by various names, *ovum anguinum*, *ophites*, *serpent-stone*, *adderhead*, *Druidical head*, etc., have been held in high veneration, and endowed with extraordinary virtues. The *ovum anguinum* described by Pliny would appear from his description to have been a fossil echinoderm. Glass spindle-whorls, which are known to have been in use within the past four hundred years, have been sold at a recent day as the true *ovum anguinum*; and fossil echinoderms have also been within a few years treasured as *Druidical* relics, and regarded as possibly possessing a portion, at least, of the virtues attributed by the ancients to the ophites.

**ophitic** (ō-fī'tēk), *a.* [*Gr.* *ὄφις* + *-ic*.] An epithet applied by various lithologists to a structure, especially characteristic of certain diabases and dolerites, in which the augitic constituent is separated into thin plates by interposed lath-shaped crystals of plagioclase, although the identity of the augite crystal is not lost, as is shown by the similar optical orientation of the separated portions.

**Ophiuchus** (of i-ū'kus), *n.* [*L.*, < *Gr.* *ὄφις* + *χρῶς* (tr. by *L.* *Anguipetens* as well as *Serpentarius*), a constellation so called, lit. 'holding a serpent,' < *ὄφις*, a serpent, + *ἔχω*, hold: see *hætic*.] An ancient northern constellation, representing a

man holding a serpent; the Serpent-bearer. Also called *Serpentarius*. The Serpent is now treated as a separate constellation.

Incensed with indignation, Satan stood  
Interrified, and like a comet burnt,  
That fires the length of *Ophiuchus* huge  
In the arctic sky.  
Milton, P. L., li. 709.

**Ophiura** (of i-ū'ri), *n.* [*N.L.*, < *Gr.* *ὄφις*, a serpent, + *οὐρά*, a tail.] A genus of sand-stars or brittle-stars, variously restricted by different authors. The term is used with great latitude of definition, and gives name to a family and to the whole order to which it belongs. In the late most restricted sense it is discarded, and *Ophiuroidea* is substituted, giving name to a family *Ophiuroidea*.

**ophiuran** (of i-ū'ran), *n.* and *n. I.* Of or pertaining to the genus *Ophiura* in any sense, or to the order *Ophiuroidea*.

**II. n.** A member of the *Ophiuroidea*.

**Ophiuridae** (of i-ū'ri-dē), *n. pl.* [*N.L.*, < *Ophiura* + *-idae*.] A group of ophiurans. (a) In the widest sense, the whole order *Ophiuroidea*. (b) In a middle sense, the ordinary ophiurans with simple arms. (c) In the narrowest sense, the family represented by *Ophiura* or *Ophiurina*, and now called *Ophiurinae*. See cut under *Astrophyton*.

**ophiuroid** (of i-ū'roid), *a.* and *n.* [*N.L.*, *Ophiura* + *-oid*.] *I.* A. Ophiuran in the widest sense; of or pertaining to the order *Ophiuroidea*.

**II. n.** An ophiuran; any member of the *Ophiuroidea*.

**Ophiuroidea** (of i-ū'roi-dē), *n. pl.* [*N.L.*, < *Ophiura* + *-oidea*.] An order of echinoderms of the class *Stellerida* or starfishes, containing the brittle-stars, sand-stars, or ophiurans. They are starfishes with a more or less well-defined central disk distinct from and not passing into the arms or rays, and no anal orifice. The axis of the arms is composed of a series of calcareous ossicles called *vertebrae*, each of which is composed of two parts representing the ambulacral plates of ordinary starfishes, and the axis is covered with plates or with continuous integument, usually bearing spines. The ambulacral nerve, water-vessels, and neural canal are within the hollow of the arm. The water-foot or pedicels are without suckers or ampullae, and protrude between the lateral plates of the arms. The mouth is pentagonal, and each angle is composed of five pieces. The order falls naturally into two leading divisions, according as the arms are simple or branched. These are sometimes called families, *Ophiuridae* and *Astrophytida*; sometimes they are considered as suborders, when the former group is known as *Ophiurina* or *Ophiuræ*, and further subdivided into several families, of which the *Ophiuridae* proper constitute one. = *Syn.* The uses of *Ophiura* and its derivatives are almost inextricably blended; but in general (a) *Ophiuroidea* or *Ophiuridae* or *Ophiuroidea* or *Ophiurinae* are the major terms of the series, naming the whole group of ophiurans; (b) *Ophiuridae*, *Ophiuræ*, *Ophiurinae*, *Ophiuræ*, *Ophiuræ* are middle terms designating the simple ophiurans as distinguished from the caryacans or *Astrophytida*; and (c) *Ophiuridae* is the minor term, designating a restricted family.

It includes 33 genera, especially of southern Africa, of which *Ophrys* is the type, and *Orechis*, *Habenaria*, and *Dia* are the best-known, all terrestrial, with the roots a cluster of thickened fibers, producing an annual unbranched leafy stem, with a terminal spike or raceme of bracted flowers. See *poppy* and *Papaver*. The opium exudes as a milky juice from shallow incisions made in the partly ripened capsules or heads still on the plant. It soon thickens, is collected by scraping, and kneaded into a homogeneous mass, forming then a reddish-brown sticky gum-like substance of bitter taste and peculiar odor. Opium was known to the Greeks, but was not much used before the seventeenth century; at present it is the most important of all medicines, and its applications the most multifarious, the chief of them being for the relief of pain and the production of sleep. Its habitual use is disastrous and difficult to break up. It is classed as a stimulant narcotic, acting almost exclusively on the central nervous system when taken internally; in large quantities it is a powerful narcotic poison, resulting in a coma characterized by great contraction of the pupils, insensibility, and death. The chief active principle of opium is morphia, but it also contains at least sixteen other alkaloids, some of which have similar properties. (See *narcotine*.) Though opium can be produced in Europe, the United States, etc., its commercial production is limited to countries where labor is cheap and the drug in common use, namely Turkey, Persia, Egypt, India, and China. The Western market is supplied largely from Asia Minor. The Indian export goes chiefly to China.

**opossum** (ô-pos'um), *n.* [Formerly also *opasom*; also, and still in rural use, abbr. *possum*, formerly *possumme*; Amer. Ind.] 1. An American marsupial mammal of the family *Didelphyidae* (which see for technical characters). They have the four kinds of teeth which carnivorous quadrupeds regularly possess (incisors, canines, premolars, and molars), and are omnivorous, eating flesh and carrion, reptiles, insects, and fruits. The head is conical, and the snout somewhat resembles that of a pig; the ears are large, leafy, and rounded; the eyes are small; the whiskers are long; the legs are of proportionate length; both fore and hind paws are five-toed, fashioned like hands, especially the hind ones, which have an opposable thumb; and the tail is generally long, scaly, and prehensile, so that the animal can hang by it. The pelage is coarse; the body is stout, and in size ranges from that of a large cat to that of a small rat. Most female opossums have on the belly a pouch containing the teats, into which the young are received as soon as they are born. They are born extremely small and imperfect. The Virginia opossum has 13 teats, and no doubt may have as many young at a birth, but the number is usually less. Opossums are nocturnal animals; they move on the ground rather slowly and awkwardly, but are more at home in trees, and some of the species are aquatic. Though they are uncleanly, the flesh is white and palatable, especially in the autumn, when they feed much on fruits, and become as fat as pigs. They commonly appear stupid, and in confinement continue sullen and intractable. When caught or threatened with danger they feign death, and will submit to the most brutal maltreatment without showing a sign of animation, whence the proverbial expression "to play possum." Most opossums belong to the genus *Didelphis*, ranging from middle latitudes in the United States through the greater part of South America. The commonest and best known is *D. virginiana*. There are perhaps a dozen others, among them pouchless ones, as *D. dorsigera*. The yapoks or water-opossums of South America form another genus, *Chiroscutes*.

Amongst the Beasts in Virginia there are two kinds most strange. One of them is the Female *Possumme*, which

(b) The angle which the visual axes of the eyes make with one another as they tend to meet at some distance before the eyes. (c) The angle between the optic axes in a biaxial crystal.—**Optic axis**. (a) See *axis*. (b) The line in a doubly refracting crystal in the direction of which no double refraction occurs. Crystals belonging to the tetragonal and hexagonal systems have a single optic axis, coincident with their vertical crystallographical axis; hence they are said to be *uniaxial*. Crystals belonging to the orthorhombic, monoclinic, and triclinic systems have two optic axes, and hence are *biaxial*.—**Optic chiasm**, in *anat.*, the commissure, decussation, or chiasm of the right and left optic nerves. See *chiasma*, and cuts under *brain* and *corpus*.—**Optic commissure**. Same as *optic chiasm*.—**Optic cup**, a concave or cup-like area formed by the involution of the distal extremity of the primary optic vesicle.—**Optic disk**, the slightly oval area on the retina formed by the entrance of the optic nerve. It is somewhat elevated, and is also called the *optic papilla*, *colliculus nervi optici*, and *porus opticus*.—**Optic foramen**. See *foramen*.—**Optic ganglia**, the corpora quadrigemina or bigemina.—**Optic groove**, the groove lodging the chiasm on the upper surface of the sphenoid bone, in front of the olivary eminence.—**Optic lobes** (*lobi optici*), the dorsal part of the midbrain or mesencephalon. The lobes are paired, right and left, and hence called *corpora bigemina*, in animals below mammals.

In man and other mammals each lobe is also marked by a cross-furrow, so that the two lobes form four protuberances, whence they are called *corpora quadrigemina*, and consti-

Brain of Pike (*Esca lucina*), anoseoushish, with optic lobes, C, as large as the cerebral hemispheres; A, olfactory nerves or lobes; D, cerebellum.

tute what are called in human anatomy the *nates* and *testes* of the brain. The optic nerves arise in part from the optic lobes. These important lobes decrease in relative size as the vertebrate scale ascends; thus, in some fishes they are quite as large as the cerebral hemispheres, and lie uncovered upon the surface of the brain; they are quite large in reptiles and birds; small in mammals (in man smallest in proportion both to the cerebrum and to the cerebellum), and entirely covered in, so that they do not appear upon the surface of the brain. See cuts under *cerebral* and *corpus*.—**Optic nerves** (*nervi optici*), the nerves of sight; the nerves of the special sense of vision, arising from the anterior quadrigeminal and external geniculate bodies and the pulvinar, and terminating in the retina. These nerves are purely sensory, and by means of them the retinal stimulations affect the brain—a process by which vision is accomplished. The optic nerves of opposite sides decussate or form the optic chiasm, and the phrase is sometimes restricted to the part of these nervous trunks beyond the chiasm, the rest being called the *optic tract*. See cuts under *brain*, *corpus*, and *eye*.

**Optic neuritis**. See *neuritis*, and cuts under *corpus* and *eye*.—**Optic pad**, a pad-like elevation at the end of the arms of a starfish on which an eye is situated.—**Optic papilla**. See *Stylommatophora*.—**Optic thalamus**, a large ganglion of the thalamencephalon, situated upon the crus and separated from the lenticular nucleus by the internal capsule. It gives origin to some of the fibers of the optic nerve. Also called *thalamus*. See cuts under *cerebral* and *corpus*.—**Optic tract** (*tractus opticus*), the part of the whole course of the optic nerves which is between the chiasm and the respective origins of the nerves. In man the tracts are narrow flat bands of white nerve-tissue crossing the crura, to which they are closely attached.—**Optic tubercles**, the corpora quadrigemina. See *bipennium*.—**Optic vesicles**, in *Cyprina*, a pair of vesicles developed from the anterior cerebral vesicles of the embryonic brain. = *Syn. Optic, Optical*. The former is chiefly said of the anatomy of the eye and of the physiology of vision, the latter chiefly of the science of optics: as, *optic nerve*, *tract*, *lobe*; *optical angle*, *center*, *effect*.

**II. n. 1.** The eye. [Now chiefly colloq.]

Quickly cold indifference will ensue.

Relating to or connected with the science of optics; based on or constructed in accordance with the laws of optics: as, *optical laws*; *optical instruments*.—2. Pertaining to vision; optic.—3. Treating of or studying optics: as, *optical writers*. Boyle, *Works*, I. 673.—**Optical anomaly**. See *anomaly*.—**Optical center**, in a lens, a point so situated that the direction of every ray passing through that point remains unaffected by its transmission through the lens—that is, the incident and emergent parts of the ray are parallel. Geometrically it is defined as the point in which the optical axis of the lens is cut by the line joining the two points where any pair of parallel planes touch the opposite surfaces of the lens. In a double-convex or double-concave lens the optical center lies within the lens; in a plano-convex or plano-concave lens it is the point where the curved surface of the lens is pierced by the axis; in the meniscus and concavo-convex it lies outside of the lens, beyond the surface which is most strongly curved. If the thickness of the lens is small compared with its focal length, the dimensions of object and image will be very nearly proportional to their distances from the optical center. Combinations of several lenses do not possess an optical center.—**Optical circle**, in physics, a graduated circle, fitted with the necessary appliances, used for illustrating the laws of refraction and reflection, or, when accurately constructed, for measuring interfacial angles, refractive indices, etc.—**Optical densimeter**, *equation*, *glass*, *meteorology*, *square*, etc. See the nouns. = *Syn.* See *optic*.

See *geometric*.—**Physical optics**, that branch of optics which includes the phenomena of diffraction, interference, double refraction, and in general that division of the subject which is explained by reference to the undulating theory and the behavior of light-waves under various conditions.—**Physiological optics**, that branch of physiology which treats of the eye and the sight-function.

Between the eye and the speculum is a piece of parallel-faced glass with a small dot on its center, exactly in the focus of the eye-glass. This dot is made to pass over the outlines of an object, and a pencil fixed at the eye-end traces the delineation on paper.

**optimism** (op'ti-mizm), *n.* [*< F. optimisme* = *Sp. Pg. optimismo* = *It. ottimismo* = *G. optimismos*, very good, best; see *optimum*.] 1. In metaph.: (a) Properly, the metaphysical doctrine of Leibnitz that the existing universe is the best of all possible universes. The most characteristic moments of the doctrine are two: first, that the Creator selected this universe from a number of others which he might have created; and second, that all of these presented certain imperfections or disadvantages which omnipotence could not avoid. (b) The doctrine that the universe advances on the whole, so as to be tending toward a state in the indefinite future different in its general character from that in the indefinite past. This is better called *evolutionism*. It is opposed to *pessimism*, which holds that the universe is tending to the nothingness from which it sprang, and to *Epicureanism*, which holds that the universe is not tending from any general state to any other general state.

2. The belief, or disposition to believe, that whatever exists is right and good, in some in-separable way, in spite of all observations to the contrary.

The Christian optimism is the recognition that in a spiritual world a spiritual being, as such, cannot find an absolute limit or foreign necessity, against which his life must be broken in pieces; but that, on the contrary, all apparent outward limits, and even death itself, are for it but the means to a higher freedom and realization of self.

E. Caird, *Revel*, p. 217.

It seemed to chill the flow of the good fellow's optimism so that he assented with but lukewarm satisfaction.

Howells, *Modern Instance*, ix.

A. J. Rev., CXXVII. 461.

2. One who believes in the present or ultimate supremacy of good over evil; one who always hopes for and expects the best; a person of hopeful disposition.

One such I knew long since, a white-haired man, . . . A genial optimist.

Bergant, *Old Man's Counsel*.

**II. a.** Of or pertaining to optimism; optimistic: as, the *optimist* view.

**optimistic** (op'ti-mis'tik), *a.* [*< optimist* + *-ic*.] Of, pertaining to, or characterized by optimism; disposed to take the most hopeful view of a matter; hopeful; sanguine.

"The minimum or zero point is the point at which the performance is just possible; the *optimum point*, at which it is carried on with the greatest activity; and the maximum point, at which it is arrested." (Vines.)

Every vegetative (and fructificative) process has certain limits of temperature, and a fixed optimum in each species.

De Bary, *Fungi* (trans.), p. 353.

**option** (op'shon), *n.* [*< F. option* = *Sp. opción* = *Pg. opção*, *< L. optio*(-n-), choice, free choice, option, *< optare*, choose; see *optate*.] 1. Choice; wish; preference; election.

Transplantation must proceed from the option of the people, else it sounds like an exile.

Bacon.

2. The power or liberty of choosing; the right or power of choice; the opportunity of electing or selecting an alternative or one of several lines of conduct; the power of deciding on a course of action: as, that is not left in my option; it is at your option to take it or leave it.

In the European nations a constantly increasing number of persons find themselves in circumstances in which a large option is allowed them as to the plan on which they will conduct their lives.

T. H. Green, *Prolegomena to Ethics*, § 335.

—4. On stock and other exchanges, a privilege, secured by the payment of a certain premium or consideration, either (1) of calling for the delivery, or (2) of making delivery, of a certain specified amount of some particular stock or kind of produce, at a specified price, and within specified limits of time. The first kind of option is usually designated a *call*, and the second a *put*; but both are sometimes called *futures*.

5†. A wishing; a wish.

I shall conclude this epistle with a pathetic option: O that men were wise!

Lawyer's Def. of Christ (1730), p. 23.

**Buyer's option**. See *buyer*. **Local option**. See *local*.—**Seller's option**. See *seller*.—**Syn.** 2. *Option*, *Choice*, *Preference*, *Election*. *Option* is the right of choice, the freedom to choose between two or more; as, "there is no option," Shedd, *Homiletics*, p. 50. *Choice* is primarily the act of choosing, but, by extension, may be the same as *option*; as, he gave him the *choice*. *Preference* is primarily the state of mind determining the choice, and see-

ordinarily the act of choosing. *Election* emphasizes the leaving of some while choosing others. *Choice* and *preference* may apply to the which is chosen; the others not. **optional** (op'shon-al), *a.* and *n.* [*< optio* + *-al*.] **I.** *a.* 1. Left to one's option or choice; depending on choice or preference.

If to the former the movement was not *optional*, it was the same that the latter chose when it was *optional*.

**optometer** (op-tom'e-tēr), *n.* [*< Gr. ὀπτικός* (*optikos*), of seeing, + *μετρον*, a measure.] An instrument for measuring the refractive powers of the eye. Also *optim'eter*.

**optometry** (op-tom'et-ri), *n.* [*< Gr. ὀπτικός* (*optikos*), of seeing, + *μετρον*, a measure. Cf. *aptometer*.] **1.** The measurement of the range of vision.—**2.** The measurement of the visual powers in general (including the acuteness of the perception of form, of light, and of colors—eidometry, photometry, and chromatometry respectively), of the extent of the visual field (periometry), of the accommodative and refractive states of the eye (dioptry), and of the position and movements of the eyeball (ophthalmometry and ophthalmotopometry).

There in full opulence a banker dwelt,  
Who all the joys and pangs of riches felt.

*Swift, Mr. Thomas Snow.*

Barbarous opulence, jewel-thick,  
Sunk'd itself on his breast and his hands.

*Tennyson, Maud, xiii.*

**=Syn.** *Opulence, Wealth, Riches, Affluence.* All these words imply not only the possession of much property, but the possession of it under such circumstances that it can be and is enjoyed. They seem contrasted not only with their opposites, but with the possession of a moderate amount. *Opulence* is a dignified and strong word for wealth. *Wealth* and *riches* may mean the property possessed, and *riches* generally does mean it; the others do not. *Affluence* suggests the flow of wealth to one, and resulting free expenditure for objects of desire. There is little difference in the strength of the words.

**opulency** (op'ū-len-si), *n.* [*As opulence* (see *-cy*).] Same as *opulence*.

Pliny as growing.] A genus of cacti, type of the tribe *Opuntia* in the order *Cactaceae*, having the stamens shorter than the half-erect petals. There are about 200 species, of warmer America, with one species widely scattered throughout the Old World. They are fleshy herbs, shrubby plants, or sometimes trees, their branches usually composed of flattened or globose joints, with hairy tubercles which are set with sharp spines. They bear small scales like leaves on the younger branches, lateral yellow, red, or purple flowers, and pear-shaped berries. For uses and names, see *cactus*; and *prickly-pear*; also *Indian fig* (under *fig*), *hedgerhog-thistle*, and *tuna*.

It contains 4 genera, of which *Opuntia* is the type and only important one, and about 250 species, principally American. They are succulent perennials, shrubs or sometimes trees, armed with sharp spines. Their usually lateral and large flowers are followed by pear-shaped or roundish berries. See cut under *Opuntia*.

**opus** (ō'pus), *n.*; pl. *opera* (op'e-rā). [L., work, a work; see *opera*.] Work; a work, as a literary or musical composition (in the latter use often abbreviated *op.*). The doctrine that the sacraments confer benefits *ex opere operantis*, from the act of the person acting or taking part in them, is regarded as a distinctively Protestant view, in opposition to the doctrine that the benefit is derived *ex opere operato*.—**Opus operatum**, literally, a work wrought; in *scholastic* and *Roman Catholic theology*, the due celebration of a sacrament, considered as necessarily and inherently involving the grace of the sacrament. Sacramental grace is said by Roman Catholic theologians to be conferred *ex opere operato*, from the (sacramental) act performed, the sacrament deriving its power from the institution of Christ, and not from the merit of the minister or recipient. Sacraments

are therefore viewed as conveying grace to the recipient, unless by want of the due dispositions, such as faith, love, repentance, etc., he wilfully interposes a barrier which prevents his receiving the grace. Certain schoolmen are thought to have taught that the sacraments produce their full effect in all cases without restriction, and this doctrine has often been imputed by Protestant controversialists to the Roman Catholic Church, instead of that contained in the decrees of the Council of Trent (session vii., canon viii.) as explained by Bellarmine and others, and given above. Anglican theologians have sometimes used this phrase to express the doctrine of the Church of England that the inward grace is one of the two integral parts of a sacrament (*& tunc*), that the sacraments are signs which are effectual (Article xxv.), and that, as the English bishops declared at the Savoy conference, "sacraments have their effects where the receiver doth not 'ponere obicem,' put any bar against them." *Procter, Book of Common Prayer* (Amer. ed.), p. 124.—**Opus phrygium**, in the middle ages, embroidery. Compare *Phrygian work* (under *Phrygian*) and *auriphygia*.—**Opus plumarium**, an old name for *feather-stitch*.—**Opus punctatum**. Same as *pounced work*.—**Opus reticulatum**, in masonry, regular stonework or brickwork in square blocks, the courses of which are inclined at an angle of 45° to the horizon, so that the joints resemble a network.—**Opus Saracenicum**, Saracenic work (that is, tapestry, rugs, etc.), imported from the East.—**Opus sectile**, a kind of pavement formed of slabs or tiles of glass or other material, the pieces having a definite size, far larger than the tesserae of ordinary mosaic. They are sometimes of plain color and sometimes mottled and veined.—**Opus signinum**, a kind of tough cement or stucco used by the ancient Romans to coat the interior of aqueducts, etc.—**Opus spicatum**, herring-bone masonry.—**Opus tessellatum**, a pavement with designs executed in pieces of different colors, called *tesserae* or *tessellae*, of larger size and more regular form than the pieces used in mosaic.

**opuscle** (ō'pus'cl), *n.* Same as *opuscule*.

**opusculo** (ō'pus'kul), *n.* [*< F. opusculo* = Sp. *opusculo* = Pg. *opusculo* = It. *opuscolo*, *opuscolo*, *< L. opusculum*, a little work, *< opus*, a work; see *opus*.] A small work; especially, a literary or musical work of small size.

*colo*, *< L. oraculum*, syncopated *oraculum*, a divine announcement, a prophecy, a place where such were given, *< orare*, pray: see *oration*.] **1.** In *class. antiq.*: (a) An utterance given by a priest or priestess of a god, in the name of the god and, as was believed, by his inspiration, in answer to a human inquiry, usually respecting some future event, as the success of an enterprise or battle, or some proposed line of conduct. Such oracles exerted for centuries a strong influence upon the course of human affairs, the belief of both the medium and the questioner in their divine inspiration being in most cases genuine. The oracles themselves, however, were often ambiguous or at least obscure. The prestige of the chief oracular seats of Greece was powerful in the promotion of good government and justice. After the introduction of Christianity the utterance of oracles gradually ceased. It was a common belief of early Christians that the oracles actually proceeded from evil spirits.

Thither come,  
And let my grave-stone be your oracle.

A rather low branching evergreen fruit-tree, *Citrus Aurantium*, with greenish-brown bark, elliptical or ovate coriaceous leaves, the petiole often winged, and fragrant white flowers. It is long lived and extremely prolific. When no longer fruitful, its hard, fine-grained, yellowish wood is valued for inland work and fine turnery. Its flowers are prized when fresh (see *orange-blossom*), and chiefly those of the bitter orange yield neroli-oil and orange-water. The varieties of the orange are very numerous, distinguished most obviously by their fruit. Its origin is referred to India, whence it spread to western Asia, thence reaching Spain and Italy, through the agency of the Moors and the crusaders, between the eleventh and fourteenth centuries. It is now cultivated in nearly all tropical and subtropical lands, including China and Japan, the whole Mediterranean basin, the West Indies, and the southern borders of the United States, having, indeed, become thoroughly wild in Florida.

very different from those of man, in whom the height and the reach of the arms are nearly the same. The arms of the orang-utan reach nearly to the ground when the animal stands erect. This attitude is difficult and constrained, and is not ordinarily assumed. The animal is most at home in trees where it displays extraordinary agility. In walking on level ground it stoops forward, brings the hands to the ground, and swings the body by the long arms, much

as a lame person uses crutches. Both hands and feet are long and narrow, with bent knuckles and short thumbs and toes, so that the palms and soles cannot be pressed flat upon plane surfaces. The face, hands, and feet are naked, and the fur is scanty or thin, though rather long; it is of a brownish-red or auburn color. Orang-utans live in trees, where they build large nests and feed on fruits and succulent buds or shoots. The strength of the animal is great in proportion to its size, and when brought to bay it proves a formidable antagonist. Also *orang*.

**oratorio** (or-ā-tō-ri-ō), *n.* [*< It. oratorio*, < L.L. *oratorium*, a place of prayer, an oratory or a chapel. The name was originally given to sacred musical works because they were first performed in the oratory of the church of Sta. Maria in Vallicella, under the patronage of Philip Neri: see *oratory*.] 1. A place of worship; a chapel; an oratory.—2. A form of extended musical composition, more or less dramatic in character, based upon a religious (or occasionally a heroic) theme, and intended to be performed without dramatic action and scenery.

The modern oratorio and opera both date from the musical revolution in Italy, about 1600, and were originally indistinguishable from each other, except that one was sacred and the other secular in subject. Both employed the same musical means, such as recitatives, arias, duets, choruses, instrumental accompaniments and passages, and at first even dancing also (for which see *opera*), and both were dramatically presented. But before 1700, particularly in Germany, the oratorio began to be clearly differentiated from the opera, in the relinquishment of dramatic action and accessories, though not usually of dramatic personification, in the more serious and reflective treatment of both arias and choruses, and in the freer use throughout of contrapuntal resources. The oratorio, therefore, came to belong essentially to the class concert music, with more or less of the qualities of church music. The true oratorio style has never been popular in either Italy or France, but has had a remarkable development in both Germany and England. The strong predilection which existed before 1600 for passion-plays led in Germany directly to the cultivation of what is called the *passion-oratorio* or *passion-music*, the theme being the passion and death of Christ, and the whole work being conceived from a decidedly liturgical standpoint. The most famous example of this style is the "Passion according to St. Matthew" of J. S. Bach. In England the works of Handel in the early part of the eighteenth century initiated an interest in the concert oratorio which has been constant and wide-spread. The method of treatment of the English oratorio has varied considerably, from the epic and contemplative to the representative and dramatic, with more or less of the lyrical intermingled. While the oratorio style in general has seldom attained to the passionate intensity and complexity of the opera, it has outstripped the latter in the expression of the lofty spiritual emotions connected with religious thought. Its independence of theatrical limitations has made possible a far more free and elaborate handling of the choros as a separate artistic means, so that most oratorios are essentially choral works. The oratorio has never occupied the same position of social importance as the opera, but it has perhaps contributed more to the world's store of new artistic conceptions.

Track; course; path, especially a path, as that in a circle or an ellipse, which returns into itself; specifically, in *astron.*, the path of a planet or comet: the curve-line which a planet describes in its periodical revolution round its central body or center of revolution: as, the orbit of Jupiter or Mercury. The orbits of the planets are elliptical, having the sun in one of the foci; and they all move in these ellipses by this law—that a straight line drawn from the center of the sun to the center of any one of them, termed the *radius vector*, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. These are called *Kepler's laws* (see *law*). The attractions of the planets for one another slightly derange these laws, and cause the orbits to undergo various changes. The satellites, too, move in elliptical orbits, having their respective primaries in one of the foci. The parabolic and hyperbolic paths of comets are also called orbits. The elements of an orbit are those quantities by which its position and magnitude for the time are determined, such as the major axis and eccentricity, the longitude of the node and the inclination of the plane to the ecliptic, and the longitude of the perihelion. In the ancient astronomy the orbit of a planet is its eccentric or the deferent of its epicycle.

3. In *anat.* and *zool.*, the bony cavity of the skull which contains the eye; the eye-socket.

In man the orbits are a pair of quadrilateral pyramidal cavities completely surrounded by bone, and separated from each other by communicating with the cranial cavity and the nasal and temporal fosse, and opening forward upon the face, with the apex at the optic foramen where the optic nerve enters. Seven bones enter into the formation of each orbit, the frontal, sphenoid, ethmoid, maxillary, palatal, lacrimal, and malar, of which the first-named three are common to both orbits. Each orbit communicates with surrounding cavities by several openings, the principal of which are—with the cranial cavity by the optic foramen and sphenoidal fissure; with the nasal fosse by the lacrimal canal; with the temporal and zygomatic fosse by the sphenomaxillary fissure; with ethmoidal parts by the anterior and posterior ethmoidal foramina; and with the face by supra-orbital, infra-orbital, extra-orbital, and malar foramina. The orbit contains the eye and its associate muscular, vascular, glandular, sustentacular, mucous, and nervous structures.

In *Diptera* the different parts of this border are distinguished as the anterior or facial orbit, the inferior or genal, the posterior or occipital, the superior or vertical, and the frontal, according to the regions of the head of which they form a part. When not otherwise stated, orbit generally means the inner margin of the eye, or that formed by the epicranium.—**Equation of the orbit**. See *equation*.—**Inclination of an orbit**. See *inclination*.—**Orbits of the ocelli**, those portions of the surface of the head immediately surrounding the ocelli or simple eyes.

Also called *temporomalar nerve*.—**Orbital plate**. (a) The os planum or smooth plate of the ethmoid bone, which in man, but not usually in other animals, forms a part of the inner wall of the orbit. (b) The thin horizontal plate of the frontal bone on both sides forming the roof of the orbit.—**Orbital process**, a process of the palatal bone which in man enters to a slight extent into the formation of the orbit.—**Orbital sulcus**. See *sulcus*.—**Orbital vein**, a vein receiving some external palpebral veins, communicating with the supra-orbital and facial veins, and emptying into the middle temporal vein.

(a) In theaters, in classic times, the orchestra was a circular or semicircular level space lying between the rising tiers of seats of the auditorium and the stage. In Greek theaters this space was circular, and was allotted to the chorus, which performed its evolutions about the thymele or altar of Dionysus, which occupied the center of the orchestra. Among the Romans the orchestra corresponded nearly to the orchestra of modern play-houses, and was set apart for the seats of senators and other persons of distinction. See diagram under *diazoma*. (b) In a modern theater or opera house, the place

Beach-flea (*Orchestra agilis*).

assigned for the orchestra-players is usually the front part of the main floor. In the opera-house at Bayreuth the orchestra is below the level of the floor, so that the players are invisible to the audience. (c) The parquette.

2. In *mod. music*, a company of performers on such instruments as are used in concerted music; a band. (In the United States *band* usually signifies a military band; but in England *band* is interchangeable with *orchestra*.) The historic development of the orchestra as now known did not begin until about 1600, when the independent value of instrumental music was first generally accepted. Up to that time, though many instruments had been known and used, both alone and as supports for vocal music, they had not been systematically combined, nor had concerted music been written for them. The process of experiment, selection, and improvement in construction and mutual adaptation went on steadily until nearly 1800, when the orchestra first arrived at its present proportions. The instruments now used consist of four main groups: (a) the *strings*, including violins (first and second), violas, violoncellos, and bass viols, these together constituting the largest and decidedly the most important group, which is often used entirely alone, and is then called the *string-orchestra*; (b) the *wood wind*, including flutes, oboes, clarinets, English horns, basset-horns, bassoons, etc., these all being used both to enrich the effect of the strings, and in alternation with them to afford contrasts in tone-quality; (c) the *brass wind*, including French horns, trumpets, cornets, trombones, euphoniums, etc., these being also used both in conjunction and in contrast with the other groups, though their decidedly greater sonority makes their introduction necessarily more rare; and (d) the *percussives*, including tympani, snare and bass drums, cymbals, bells and triangles, harps, etc., and also sometimes the piano-forte, though the latter is seldom ranked as a true orchestral instrument. The proportions of the several groups are varied somewhat both by composers and by conductors. A *full orchestra* is one in which all these groups are present in fairly complete form; a *small orchestra* is one in which some important instruments are lacking. All the above instruments, except the harp, are essentially monophonic, and the peculiar artistic importance of the orchestra is based upon the fact that every element in the total effect is produced by a solo instrument in the hands of a separate performer. The orchestra is extensively employed both in accompanying vocal music of every kind and in purely instrumental works. Its unlimited capacities for varied effect have led to the production of an extensive musical literature, in which are some of the most famous specimens of musical art. The orchestra is an indispensable factor in all extended works like operas and oratorios. The maintenance of orchestras was originally undertaken by individual princes in the several European states; but they are now either attached to opera-houses or supported by the proceeds of popular concerts.

*dāl*, a part, deal (or rather the base of the orig.  
verb), with a suffix lost in AS., but retained in  
OS. and OHG.; see *or-* and *deal*.] The techni-  
cal use of the word, the disappearance of *or-*  
as a significant prefix, and the remoteness of  
the main element *-deal* from its etym. mean-  
ing, led to a separation of the word from its  
actual source, and its treatment as of L. origi-  
n; hence the ordinary pron. in three syllab-  
les (as if the termination were like that of *real*,  
*ideal*, etc.), instead of the orig. two (ôr'dēl).]  
1. *n.* 1. A form of trial to determine guilt or  
innocence, formerly practised in Europe, and  
still in parts of the East and by various savage  
tribes. It consisted in testing the effect of fire, water,  
poison, etc., upon the accused. Well-known fire-ordeals  
in England were the handling of red-hot irons, or the walk-  
ing over heated plowshares. A common form of the wa-  
ter-ordeal was the casting of the accused into water; he  
was considered innocent if he sank, guilty if he floated.  
The practice of "dinking witches" is a survival of this  
water-ordeal, and the phrase "to go through fire and  
water" probably alludes to those customs. These ordeals  
were abolished in England in the reign of Henry III., but  
the wager of battle remained. The ordeal of poison-water  
is common in Africa; that of burning candles, in Burma;  
that of eating rice, in Siam, etc.

s of clergymen.

And the title that ge take *ordres* by telleth ge ben  
aunounced.  
*Piers Plowman* (B), xi. 281.

(b) One of the several degrees or grades of the  
clerical office. In the Roman Catholic Church these  
orders are bishop, priest (presbyter), deacon, subdeacon,  
acolyte, exorcist, reader, and doorkeeper. Originally the  
first three were accounted *major orders* and the others  
*minor orders*. Since the twelfth century the order of sub-  
deacon has been advanced to the rank of a major order, and  
the number of orders is generally counted as seven, the or-  
ders of bishop and presbyter being regarded as one order  
in so far as the sacerdotal character belongs to both. In  
the Orthodox Greek and other Oriental churches the major  
orders are those of bishop, priest, and deacon, and the  
minor orders are subdeacon, reader (anagnost), and some-  
times singer (psalter). The orders of bishop, priest, and  
deacon are known not only as *major* or *holy orders*, but as  
*apostolic orders*. The orders of subdeacon, acolyte, exorcist,  
and doorkeeper (ostiary) existed in the Western Church  
before the middle of the third century; those of subdeacon,  
exorcist, reader, singer, and doorkeeper were as old as the  
third or fourth century in the Eastern Church. The Angli-  
can Church retains only the orders of bishop, priest, and  
deacon. Major orders can be conferred by bishops only.  
Chorepiscopi, abbots, and priests have sometimes, how-  
ever, been authorized to confer minor orders.

They cannot abide  
Vnto Church orders stritlike to be tide.  
*Times' Whistle* (E. E. T. S.), p. 14.

(c) In the Roman Catholic, Greek, Anglican,  
and other episcopal churches, the sacrament  
or rite of ordination, by which ecclesiastics re-  
ceive the power and grace for the discharge of  
their several functions; specifically termed *holy*  
*order*, or more commonly *holy orders*. The bishop  
alone can administer this rite. Orders as a sacrament or  
sacramental rite are limited to the major orders.

in his *Orders* by the Bishop.

5. (a) In *zool.*, that taxonomic group which  
regularly comes next below the class and next  
above the family, consisting of one or more  
families, and forming a division (sometimes the  
whole) of a class. Like other classificatory groups, it  
has only an arbitrary or conventional taxonomic value.  
Compare *superorder*, *suborder*. (b) In *bot.*, the most  
important unit of classification above the ge-  
nus, corresponding somewhat closely to *family*  
in zoölogy. See *family*, 6. In phanerogams the  
term *family* is not technical or systematic, being some-  
times applied to suborders, tribes, or even genera. In  
cryptogams it is made a subdivision of the order by some  
authors. See *natural order*, under *natural*.

6. A number of persons of the same profes-  
sion, occupation, or pursuits, constituting a  
separate class in the community, or united by  
some special interest.

common consent under the same religious, moral, or social  
regulations; especially, a monastic society or fraternity;

ciscan *order*.

*Shak.*, R. and J., v. 2, 6.

As a broad general rule, nearly every post-Reformation institute is styled not an *Order* but a "Congregation"; but the only distinction which can be drawn between these two names is that *order* is the wider, and may include several congregations within itself (as the Benedictine *order*, for example, includes the congregations of Cluny and of St. Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.

*Encyc. Brit.*, XVI, 715.

(b) An institution, partly imitated from the medieval and crusading orders of military monks, but generally founded by a sovereign, a national legislature, or a prince of high rank, for the purpose of rewarding meritorious service by the conferring of a dignity. Most honorary orders consist of several classes, known as *knights companions*, *officers*, *commanders*, *grand officers*, and *grand commanders*, otherwise called *grand cross* or *grand cordon*. Many orders have fewer classes, a few having only one. It is customary to divide honorary orders into three ranks: (1) Those which admit only nobles of the highest rank, and among for eigners only sovereign princes or members of reigning families; of this character are the Golden Fleece (Austria and Spain), the Elephant (Denmark), and the Garter (Great Britain); it is usual to regard these three as the existing orders of highest dignity. (2) Those orders which are conferred upon members of noble families only, and sometimes because of the mere fact of noble birth, without special services. (3) The orders of merit, which are supposed to be conferred for services only. Of these the Legion of Honor is the best-known type. Two of the orders of merit may be regarded as somewhat exceptional—the first class of the Order of St. George of Russia and the Order of Maria Theresa of Austria. The former is conferred only upon a commanding general who has defeated an army of 50,000 men, or captured the enemy's capital, or brought about an honorable peace. There is now no person living who has gained this distinction regularly, though it has been given to a foreign sovereign. Other orders of merit approach these more or less nearly, as they are conferred with more or less care. The various orders have their appropriate insignia, consisting usually of a collar of design peculiar to the order, a star, cross, jewel, badge, ribbon, or the like. It is common to speak of an order by its name alone, as the Garter, the Bath. An order is said to be *conferred* or *bestowed* upon the recipient of its distinction; the recipient is said to be *decorated* with such an order; and the word *order* is often applied to the decoration or badge. See *bath*, *garter*, *knighthood*, *star*, *thistle*, etc.

10. In *rhet.*, the placing of words and members in a sentence in such a manner as to contribute to force and beauty of expression, or to the clear illustration of the subject.—11. In *classical arch.*, a column entire (including base, shaft, and capital), with a superincumbent entablature, viewed as forming an architectural whole or the characteristic element of a style. There are five orders—Doric, Ionic, Corinthian, Tuscan, and Composite. (See these adjectives.) Every order consists of two essential parts, a column and an entablature; the column is normally divided into three parts—base, shaft, and

capital; the entablature into three parts also—architrave, frieze, and cornice. The character of an order is displayed not only in its column, but in its general form and details, of which the column is, as it were, the regulator. The Tuscan and Composite are Roman orders, the other three are properly Greek. The Roman renderings of them being so different from the originals as to constitute in fact distinct orders. The Corinthian, though of purely Greek origin, did not come into extensive use before Roman authority was established throughout Greek lands.

The temple on the side of the river seems to be of the greatest antiquity, and was probably built before the *orders* were invented.

*Poncke*, Description of the East, II. i. 135.

12. In *math.*: (*a*) In geometry, the degree of a geometrical form considered as a locus of points, or as determined by the degree of a locus of points. Newton introduced the term *order* as applied to plane curves. Cayley defines the *order* of a relation in *n*-dimensional space as follows: add to the conditions as many arbitrary linear conditions as are necessary to make the multiplicity of the relation equal to *m*; then the number of points satisfying these conditions is the *order* of the relation. Thus, the *order* of a *plane curve* is the number of points (real and imaginary) in which this curve is cut by an arbitrary right line. **2.** The act of admitting to holy orders, or to the Christian ministry; the rite of conferring holy orders or investing with ministerial or sacerdotal power and authority. In episcopal churches, including the Roman Catholic Church, the Greek and other Oriental churches, and the Anglican Church, ordination consists in imposition of hands by a bishop upon the candidate, thus admitting him to one of the holy orders, and conferring on him the powers of that order and authority to perform its functions. The act of elevation to the episcopate is in strict technical use called *consecration*, not *ordination*. *Ordination* in its wider sense includes admission to the minor orders, which are usually conferred in the Roman Catholic Church by a bishop, but can be bestowed by an abbot, the act of admission consisting in the tradition (delivery) of the instruments. In Presbyterian churches the power of ordination rests with the presbytery, who appoint one or more of their number to conduct the ordination ceremonies, which include laying on of hands. In Congregational and Baptist churches ordination is customarily performed by the pastors of other churches (of the same denomination), but is regarded as necessary only for the preservation of church order; and the service is regarded as conferring no special religious authority. See *institution, induction, installation*.

As for *Ordination*, what is it but the laying on of hands, an outward signe or symbol of admission?

As a technical term, it designates all heavy pieces fired from carriages. Modern ordnance may be divided into two classes, *smooth-bore* and *rifled*. The former are all muzzle-loaders; the latter are subdivided into *muzzle-loaders* and *breech-loaders*. Most guns of modern construction are breech-loading rifled arms. Classified according to the material used, cannon are *bronze*, *cast iron*, *wrought-iron*, *steel*, or *intze cast* (*wrought-iron* and *steel* guns; according to the method of construction, they are called *solid* or *built-up* guns. **Board of ordnance.** (a) Formerly, in Great Britain, a board, consisting of a master-general, surveyor-general, clerk, and storekeeper (usually members of Parliament), which provided the army and navy with guns, ammunition, and arms of every description, and superintended the providing of stores, equipment, etc. The Crimean disasters in 1854 showed the defects of this board, which was shortly afterward dissolved. (b) A board composed of United States ordnance officers distinguished for their attainments in the theory and practice of heavy ordnance, its construction and use, whose duty it is to conduct experiments, and test and report upon all ordnance subjects referred to it by the chief of ordnance. This board is designated by the Secretary of War, and is advisory to the chief of ordnance of the army.—**Bureau of Ordnance.** See *Department of the Navy, under department*. **Master of the ordnance.** See *master*.—**Ordnance corps.** Same as *ordnance department*.—**Ordnance department.** See *department*.—**Ordnance storekeeper.** See *storekeeper*.—**Ordnance stores,** a general phrase including everything pertaining to the manufacture, equipment, and service of ordnance or artillery. It comprises all projectiles and explosives, pyrotechnic stores, gun-carriages, caissons, limbers, mortar-beds, cavalry and artillery forges, battery-wagons, and all machines for mechanical maneuvers and for transportation, tools and materials for fabrication, repair, or preservation, all small-arms, accoutrements, and equipments for artillery, cavalry, and infantry. The phrase "ordnance and ordnance stores," covers everything in the form of a weapon that is used in war, together with all the materials and appliances necessary for their construction, repair, preservation, and use.—**Ordnance survey,** the survey of Great Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties; and rivers, roads, houses, etc., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is, for towns having 4,000 or more inhabitants,  $\frac{1}{25,000}$  of the linear measurement, which is equivalent to 126.72 inches to a mile, or 1 inch to 41½ feet; for parishes (in cultivated districts),  $\frac{1}{25,000}$  of the linear measurement, equal to 25,344 inches to a mile, or very nearly 1 square inch to an acre; for counties, 6 inches to a mile; for the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be levied and roads, railways, canals, and other public works laid out and executed.—**Rifled ordnance.** See *rifled cannon, under cannon*.

**Ordovician** (ôr-dô-vish'ian), *a.* [Named from the *Ordovices*, an ancient British (North Welsh) tribe.] An epithet applied by C. Lapworth to a series of rocks not capable of exact separation from those underlying or overlying them, either stratigraphically or paleontologically, but which have been the subject of much discussion among English geologists. They form a part of the Lower Silurian of Murchison, more or less of the Upper Cambrian of Sedgwick, the Cambro-Silurian of Jukes, the Siluro-Cambrian of some authors, the second fauna of Barrande, etc. As limited in Wales, according to H. B. Woodward, the Ordovician may be said to extend from the base of the Arenig series to the base of the Llandovery. Graptolites and trilobites are the most abundant fossils, and there is a large amount of intercalated volcanic material. The name Ordovician does not appear in the text-book of geology recently issued by the director of the Geological Survey of Great Britain, nor has it any place in American Silurian geology as worked out by the New York and Pennsylvania Surveys, nor can the strata thus named in England be strictly paralleled with any one or more divisions of the Silurian as established in the United States.

Skt. *ayas, metal.*] **1.** A metalliferous mineral or rock, especially one which is of sufficient value to be mined. A mixture of a native metal with rock or veinstone is not usually called *ore*, however, it being understood that in an ore proper the metal is in a mineralized condition—that is, exists in combination with some mineralizer, as sulphur or oxygen. The ore and veinstone together constitute the mass of the metalliferous deposit, vein or lode. The ore as mined is usually more or less mixed with veinstone, and from this it is separated, as completely as may be convenient or possible, by dressing. It then usually goes to the smelter, who, by means of a more or less complicated series of operations, frees it from the worthless material which still remains mechanically mixed with it, and also sets it free from its chemical combination with the substances by which it is mineralized.*

2. Metal; sometimes, specifically, a precious metal, as gold.

The rods of Corti are long, narrow, rigid columnar cells, rising from a conical base and arranged in an inner and an outer row; they incline toward each other and interlock by their heads, forming thus the arch of Corti. Adjoining the inner acoustic rods there is a single row, and externally to the outer rods four to six (in man) rows of acoustic hair-cells; these are long columns, inclined with the rods, attached to the basilar membrane, and terminating in a rounded extremity furnished with a curved row of short, stiff, terminal, hair-like filaments. The term *organic*, as applied to any substance, in no way relates to the presence or absence of life. The materials which compose the living body are of course *organic* in the main, but they are equally so after death has occurred at any rate for a certain time—and some of them continue to be so for an indefinite period after life has departed. **Oribates** (ō-rib'ā-tēz), *n.* [NL. (Latreille, 1801), < Gr. ὄριβατος, mountain-ranging, < ὄρος, a mountain, + βαίνειν, go.] A genus of beetle-mites, typical of the family *Oribatidae*, having the cephalothorax with lamellar appendages, the vertex with bristly hairs, and the middle claw larger than the others. There are probably many more species than have thus far been determined. *O. orivorus* is a useful mite, which feeds on the eggs of the cankerworm-moth in the United States. Also *Oribates*.

**Oribatidæ** (or-i-bat'i-dē), *n. pl.* [NL. < *Oribates* + -idæ.] A family of tracheate acarids, typified by the genus *Oribates*. They are known as *beetle-mites*, from the hard horny integument, and also as *vent-mites*. The ocelli are almost obsolete, the mandibles chelate, the short palpi four-jointed, and the legs five-jointed, all ambulatory. None is parasitic at any age, or specially injurious, and some are beneficial. About 12 genera are described. The *Oribatidæ* are sometimes divided into 2 subfamilies, *Pterasterina* or *Oribatina* proper, and *Opa-terasterina*, the latter containing 2 genera.

**oribi**, *n.* Same as *ourebi*.

**orichalc** (or'i-kalk), *n.* [Formerly also *orichalch*; = F. *orichalque* = Sp. Pg. It. *oricaleo*, < L. *orichalcum* (also erroneously *aurichalcum*, simulating *aurum*, gold), < Gr. ὀριχαλκος, rarely ὀριχαλκος, yellow copper ore, brass, lit. 'mountain-copper'; < ὄρος, mountain, + χαλκος, copper; see *chalchitis*.] The equivalent in English of the Greek ὀριχαλκος, the name of a metallurgical alloy or metal of brilliant luster, mentioned by Greek authors of a very early date, and considered by them as worthy to be classed with gold and silver in respect of value. Plato, while often speaking of it, admits that orichalc was no longer to be had in his time; and some (Aristotle, it is said, among them) deny that any such metal ever existed. The word passed into Latin under the form of *orichalcum*, and later that of *aurichalcum*. Although sometimes used as the name of brass (as by Strabo, who, with as near an approach to accuracy as was possible in those days, describes the method of manufacturing that metal and calls the alloy *orichalcum*), it had in general—even down to the middle ages—a more or less uncertain meaning, standing sometimes for an entirely ideal and very precious substance and sometimes for an ordinary metal or alloy (as copper or bronze), but having a peculiar value on account of the manner in which it was made, or the locality whence it came.

The metall was of rare and passing price;  
Not Bilbo steale, nor brasse from Corinth fet,  
Nor costly *Orichele* from strange Phenice,  
But such as could both Phœbeus arrows ward,  
And th' hayling darts of heaven beating hard.

Spenser, *Maupinotes*, l. 78.

gold; see *auricle*, *aurous*, and cf. *oriele*.] A portico, recess, or small room forming a projection from a room or building, as a hall or chapel, in the form of a large bay or recessed window, and often more richly furnished or more private than the rest of the room or building, formerly used as a boudoir, closet, and separate apartment for various purposes. It projects from the outer face of the wall, being in plan semi-hexagonal, semi-octagonal, or rectangular, etc., and is supported on brackets, corbels, or corbeling. When such a projecting feature rests upon the ground, or directly upon the foundation of the building, it is called a *bay-window*, or a *bay window*. Also called *oriel window*.

*E. L. Tylor, Prim. Culture*, II. 382.

(c) The construction or position of a church so that it has that end which contains the chancel or sanctuary in the direction of the east.

The very ancient practice of *orientation* in the building of churches can hardly be set aside as "a high church piece of pedantry." Allusion to worship towards the east may be found in the early liturgies and Church fathers; and in this country, at least, *orientation* has been practised from the first introduction of Christianity into these islands down to the present time, with the interruption of the Great Rebellion.

*X. and Q. 7th ser.*, VII. 463.

(d) Hence, the position of a building or of any object with reference to any point of the compass.

In *zool.*, the faculty or instinct by which birds and other animals find their way home after being carried to a distance. It is well illustrated by homing pigeons. (See *homing*.) A striking instance of orientation is also afforded by swallows. Thus, a swallow nesting in New England, for example, and wintering in Panama, can return to the rafters in the barn where its nest was the previous year. All the regular and periodical migrations of birds imply the faculty of orientation.

See *marjoram*, also *ditany*, 3, and *hop-marjoram*.—**Oil of origanum**, marjoram-oil.

**Origenism** (or-i-jen-izm), *n.* [*< Origen* (see def.) + *-ism*.] The opinions held by or attributed to the Greek father Origen of Alexandria (born about A. D. 185, died about 253). The main characteristics of Origen's teaching were its union of philosophical speculation with Christian doctrine and its mystical and allegorizing interpretation of Scripture. He insisted especially on the unity of all creation; he regarded Scripture as having generally a threefold sense, literal, moral, and mystical; he held the essential divinity and eternity of each person of the Trinity, but maintained that the Son is inferior to the Father and the Holy Ghost to the Son; he was the first to formulate the orthodox doctrine of eternal generation; he rejected prayer to Christ, though he defended prayer in the name of Christ; he regarded all sin as proceeding from a voluntary and moral self-determination to evil; he held that the human soul of Christ preexisted with other human souls; that the soul came into the body as a penalty for sin in a preexistent state; and he believed in a further moral progress and development after the present life, and defended as a probable opinion the restoration and final salvation of all men and of the fallen angels.

Controversy as to the lawful ritual of the Church of England has centered for many years around the question whether the ornaments rubric is still in force. A remarkable order of extinct reptiles presenting many characters intermediate between those of *Reptilia* and *Aves*, the ornithic modification being especially well marked in the pelvic arch and limb, whence the name. The ilium extends far in advance of the acetabulum, and is expansive, widely arching over the pelvic cavity, as in birds. The slender prolonged ischia, in some genera, are ornithic in character, and, in *Hypsilophodon* at least, unite in a median ventral symphysis. The phalanges in some genera are as slender and elongated as in a typical bird. The tibia has a great cnemial crest and a ridge for the fibula, and its distal end is as in a bird, with a fossa to receive the ascending process of the astragalus. The distal end of the fibula is smaller than the proximal, though not so much reduced as in birds. The astragalus, similar to that of a bird, remained distinct in many genera; but in some, as *Compsognathus*, *Ornithomimus*, and *Euskelosaurus*, it seems to have ankylosed with the tibia. The genera of *Ornithoscelida* are numerous, ranging throughout the Mesozoic period; the animals are mostly of large size, some of them, as the *Iguanodon*, being among the largest terrestrial animals known. The order is divisible into two suborders, *Dinosauria* and *Compsognathia*.

In *chem.*, specifically—(a) As a prefix of benzene derivatives it denotes a substitution of hydrogen atoms in the benzene ring which are adjacent to each other. (b) As applied to acids it notes those in which the number of hydroxyl groups present is equal to the number expressing the quantitative of the elementary radical, and applied to salts it notes those formed from ortho-acids. Where the ortho acid has not been isolated, the acid in which the number of hydroxyl groups present is nearest to the number expressing the quantitative of the elementary radical is sometimes called an ortho-acid.

**ortho-axis** (ôr'thō-ak'sis), *n.* [*< Gr. ôrtios, straight, + L. axis, axis.*] Same as *orthodiagno-*

*nal axis*—that is, the lateral axis of a monoclinic crystal which is at right angles to the vertical axis.

**orthocephalic** (ôr-thô-se-fal'ik or -sef'a-lik), *a.* [*< orthocephaly + -ic.*] Exhibiting or characterized by orthocephaly.

**orthocephaly** (ôr-thô-sef'a-lik), *n.* [*< Gr. orthocephalos, straight, + kephalē, head.*] The character of a skull whose vertical index is above 70 and not above 75; the character of a skull with an intermediate cephalic index.

**orthoceran** (ôr-thos'er-an), *a.* Pertaining to the genus *Orthoceras*. *Science*, III, 127.

**Orthoceras** (ôr-thos'er-as), *n.* [NL. (*cf. Gr. orthocephalos, straight-horned*), *< Gr. orthocephalos, straight, + keras, horn.*] The typical genus of *Orthoceratidae*, having the shell straight or but slightly curved. The species are very numerous, ranging from the Silurian to the Liassic. Also *Orthoceratites*, *Orthoceras*.

**Orthocerata** (ôr-thô-se-rā'tā), *n. pl.* [NL.: see *Orthoceras*.] Same as *Orthoceratidae*.

**Orthoceratidae** (ôr-thô-se-rat'i-dē), *n. pl.* [NL.: *< Orthoceras (-cerat) + -idae.*] A family of fossil tentaculiferous tetrabranchiate cephalopods, typified by the genus *Orthoceras*. They have a straight or scarcely curved chambered shell, with a central siphuncle and sometimes contracted aperture. Over 300 species have been described, from North America, Europe, and Australia. They are among the most profusely and widely distributed shells of the old rocks. They attained greater size than any other fossil of the time, some fragments having been found which indicate a length of 6 feet.

**orthoceratite** (ôr-thô-ser'a-tit), *n.* [*< NL. Orthoceratites.*] A fossil cephalopod of the genus *Orthoceras* or the family *Orthoceratidae*. Also *orthoceratoid*.

**Orthoceratites** (ôr-thô-ser-a-ti'tēz), *n.* [NL.: as *Orthoceras (-cerat) + -ites.*] Same as *Orthoceras*.

**orthoceratitic** (ôr-thô-ser-a-tit'ik), *a.* [*< orthoceratite + -ic.*] Pertaining to or resembling orthoceratites; orthoceran; opposed to *cythoceratitic*.

**orthochromatic** (ôr-thô-kro-mat'ik), *a.* [*< Gr. orthocephalos, correct, + chroma, color; see chromatic.*] In *photog.*, correct in the relations or in the rendering of colors—that is, free from the usual photographic fault of exaggerating the deepness of greens, yellows, and reds and the brightness of blues and violets. The epithet notes any process by means of which this end may be attained, or any plate, chemical, etc., used in such a process. Ordinary photographic dry plates in which a trace of such agents as eosin or chlorophyl is incorporated possess the orthochromatic property, which is greatly enhanced if the exposure is made through a transparent screen tinted to correspond with the prevalent color in the scene or picture, as green for a landscape, or yellow for a painting characterized by draperies of that hue. Also expressed by *isochromatic*, an epithet implying equality of exposure to obtain similar results from opposed colors, contrary to the usual photographic experience.

**orthochromatize** (ôr-thô-kro-mā-tiz), *v. t.; pret. and pp. orthochromatized, ppr. orthochromatizing.* [*< orthochromatic + -ize.*] In *photog.*, to render orthochromatic, as a plate; bring into conformity with the conditions necessary to obtain a correct rendering of color-values.

**orthoclase** (ôr-thô-klāz), *n.* [*< Gr. orthocephalos, straight, right, + klasis, fracture; see elastic.*] Common or potash feldspar, a silicate of aluminum and potassium, occurring in monoclinic crystals and also massive. It has two perfect cleavages, at right angles to each other (whence the name). It varies much in color, from white to yellow, red, and green. Adularia, including most moonstone, is a crystallized variety, transparent or nearly so, characteristic especially of the crystalline rocks of the Alps; valencianite, from Valencia, Mexico, is similar to it. Soudine is a glassy variety, usually containing more or less soda; it is characteristic of certain igneous rocks, as trachyte, phonolite, etc.; rhyacodite, from Monte Somma, Vesuvius, is similar. Loxoclase is a variety from Hammond, New York, and murchisonite one from Exeter, England, the latter showing golden-yellow reflections on a surface nearly parallel to the orthopinacoid. Orthoclase is an essential constituent of granite and some other crystalline rocks, and often occurs in large masses in granite veins, and is then quarried and used in making pottery. Much of the potash feldspar called orthoclase is really the related triclinic species microcline. The name *orthoclase* has been given to some kinds of triclinic feldspar containing considerable potash, which are more closely related to albite than to microcline in optical characters. See *feldspar*. Also called *orthose*.

**orthoclastic** (ôr-thô-klas'tik), *a.* [*< Gr. orthocephalos, straight, right, + klasis, verbal adj. of klao, break.*] Characterized by cleavages at right angles to one another; said of certain species of the feldspar group, particularly orthoclase; pertaining to such species, or specifically to orthoclase.

**orthocælic** (ôr-thô-sē'lik), *a.* [*< Gr. orthocephalos, straight, + kaelos, the belly, the intestines.*] Arranged in straight or parallel folds; applied to the intestines of birds when they are thus disposed, in distinction from *cyclocælic*.

**orthodiagonal** (ôr-thô-di-ag'ō-nal), *n. and a.* [*< Gr. orthocephalos, straight, + diagonos, diagonal; see diagonal.*] **I. n.** In *crystal.*, the diagonal or lateral axis in a monoclinic solid which is at right angles with the vertical axis; also, the plane which includes the two axes named.

**II. a.** Pertaining to or in the direction of the orthodiagonal.

**orthodomatic** (ôr-thô-dō-mat'ik), *a.* [*< orthodom + -atic.*] Pertaining to or in the direction of an orthodome.

**orthodome** (ôr-thô-dōm), *n.* [*< Gr. orthocephalos, straight, + domos, domus, a house; see dome.*] **I. n.** In *crystal.*, a dome, in the monoclinic system, parallel to that lateral axis which is at right angles to the vertical axis. It is properly a hemidome, since a given form includes but two planes. See *dome*, 1, 5.

**orthodox** (ôr-thô-doks), *a.* [= F. *orthodoxe* = Sp. *ortodoxo* = Pg. *ortodoxo* = It. *ortodossia*, *< L.L. orthodokos, < L.Gr. orthodokos, having a right opinion, < Gr. orthocephalos, straight, right, correct, + dokos, opinion; see dogma, dogology.*] **1.** Holding what is regarded as the correct opinion, or correct opinions, especially in regard to religious or theological doctrines; sound in opinion or doctrine; specifically, conforming to the faith of the Church Catholic, as represented in its primitive ecumenical creeds; applied to persons or doctrines. That which seems to one part of the Christian church orthodox may be held by another to be heterodox. Thus, the Roman Catholic Church regards Protestant churches as heterodox; again, the Reformed churches sometimes deny the title *orthodox* to one another; and generally those who hold to the Trinitarian faith deny the epithet *orthodox* to the Unitarians and Universalists. Orthodoxy is not usually denied to those who are charged with having added articles to the ecumenical faith of Christendom, but only to those who are charged with denying a part of that faith. Thus, the Roman Catholic is not ordinarily refused by Protestants the right to the epithet *orthodox*; nor are Trinitarians denied the right to that epithet by those of Unitarian belief. *Orthodox* is the common epithet of the Greek Church (of which the full official title is "the Holy Orthodox Catholic Apostolic Oriental Church"), as *Catholic* is of the Roman Church. [The word is employed locally in New England to designate the Trinitarian Congregational churches as distinguished from those of the same order which hold the Unitarian or Universalist faith, as in the phrase "the *Orthodox* Church." It is also used to distinguish the Trinitarian Quakers from those whose belief is or tends toward Unitarianism.]

'Tis the *Orthodox* Tenet, that there never was remission of sins but by the blood of the Lamb that was slain from the beginning of the World.

*Milton, Ans. to Salmasius, Works*, III, 182.

*E. J. Freeman, Venice*, p. 198.

**Orthodox school**, in *polit. econ.* See *political*.—**Syn.** **1.** *Orthodox, Evangelical.* (See the definitions of these terms.) It is natural for all who care about their doctrinal beliefs to claim the titles that indicate correctness of belief. Hence *orthodox* is a part of the name of the Greek Church; to the Roman Catholic *orthodox* means faithful to the tenets of the Roman Church; in the doctrinal contests of America *orthodox* has generally meant Calvinistic, especially as opposed to Unitarianism and Universalism; in England it has as generally meant High-church, as opposed to Low-church or *evangelical*. *Evangelical*, meaning in harmony with the Gospel, has been claimed somewhat similarly and for a like reason, but has been especially applied to those who emphasize the doctrine of salvation by faith in Christ alone.

shortness of the jaws which constitutes orthognathism. The facial angle of an orthognathous skull is large (by whichever method it is measured), the term being more or less definitely employed as the opposite of *prognathous* or *prasinathous*, where the angle is small, or as the mean between *prognathous* and *hyperorthognathous* or *episthognathous*, where the angle is excessively large. The facial angles that have been chiefly used in the definition of these terms are known as *Camper's*, *Geoffroy Saint-Hilaire and Cuvier's*, *Jacquart's*, and *Cloquet's* (which see, under *craniofacial*). A more recent facial angle is that included between the nasio-alveolar line and a line drawn through the supra-auricular point and the inferior margin of the orbit; when this is between 83 and 90, the skull is said to be orthognathous. The same character is also defined by means of the gnathic or alveolar index, whose skulls with a gnathic index below 95 being orthognathous; between 95 and 105, mesognathous; and above 105, prognathous.

**Orthoptera** (ôr-thôp'te-rā), *n. pl.* [NL. (Latreille, 1806) (*F. Orthoptères*, Olivier, 1789), neut. pl. of *orthopterus*, straight-winged; see *orthopterous*.] An order of the class *Insecta* proposed by Olivier in 1789 for certain straight-winged insects which Linnaeus had placed in *Hemiptera*, and to which De Geer in 1773 had restricted the order *Hemiptera*, placing the true bugs in a new order *Dermaptera*. The order as now understood contains insects in which metamorphosis is incomplete and wings are almost always present, of which the hinder pair are dilated, folded from the base, and of membranous texture, while the fore pair are more or less coriaceous, usually narrow and straight (but variable in this respect), and thickly veined. These insects are active and capable of feeding in all stages from birth to death. Seven families — or, as some consider, tribes or superfamilies — are now recognized. These are the *Blattidae*, or cockroaches; *Mantidae*, or praying-insects; *Phasmidae*, or walking-sticks; *Gryllidae*, or crickets; *Locustidae*, or long-horned grasshoppers or katydids; and *Aceridae*, or short-horned grasshoppers or true locusts, including the migratory species. (See *locust* for an explanation of the fact that the *Locustidae* are not locusts.) The *Orthoptera* are in the main herbivorous, but the *Mantidae* are carnivorous, and some of the *Blattidae* are omnivorous. They are found all over the world, but most numerous in the tropics, where among them are the largest known representatives of the whole insect class. All the known species are terrestrial or arboreal, no aquatic forms having been discovered; and according to their habitual mode of progression the families have been grouped by Westwood as *Cursoria*, *Raptoria*, *Ambulatoria*, and *Saltatoria*. The *Orthoptera* are among the earliest forms of insect life to appear in geologic time, and the *Blattidae* in particular are very numerous in some geological formations. The main characters used in classifying the *Orthoptera* are derived from the modifications of the genitals, mouth-parts, and antennae. See cuts under *Blattidae*, *Gryllidae*, *Insecta*, *katydid*, *locust*, and *Mantis*.

See cut under *bobolink*. (b) The sooty or sora rail, *Porzana carolina*, a wading bird of the family *Rallidae*, which throngs the marshes of the Atlantic coast of the United States early in the fall at the same time that the reed-birds are in season, and is likewise in great demand for the table. *Orvietum*, or Venice treacle, as it was sometimes called, was understood to be a sovereign remedy against poison; and the reader must be contented, for the time he peruses these pages, to hold the same opinion, which was once universally received by the learned as well as the vulgar. *Scott*, *Kenilworth*, xiii., note.

**oryctognosy** (ôr-ik'tog-nô-si), *n.* [= F. *oryctognosie*, < Gr. *ôrtyn*, dig, dug out, fossil (see *oryctes*), + *gnôsis*, knowledge.] The description and systematic arrangement of minerals; mineralogy. This term was formerly used to some extent by writers in English on geological and mineralogical topics, but rarely except in translating from French or German, the word being considered the equivalent of the French *oryctognosie* and the German *Oryctognosie*, with the corresponding adjective form *oryctognostic*. These words, as well as *arycto*, were some what extensively used by

Continental geologists, in the early part of the nineteenth century, with a meaning nearly equivalent to what is now comprehended under the terms *mineralogy* and *lithology*; and this also included more or less, according to the usage of various authors, of economical and mining or "applied" geology. The terms corresponding to *oryctology* and *aryctology* have been dropped from the Continental languages for fully fifty years, and the use of the words in English became correspondingly rare. Also *oryctography*.

The heisa antelope, *O. heisa*, is one of the best-known, supposed by some to have furnished the original of the unicorn of the ancients, the long horns seen in profile appearing as one. It inhabits North Africa, where is also found *O. leucorhynchus*, the algalzel. The South African representative is *O. capensis* or *O. gazella*, the well-known gemsbok of the Dutch colonists. **osculate** (os'ku-lät), *v.*; pret. and pp. *osculated*, pp. *osculating*. [*< L. osculatus*, pp. of *osculari*, kiss, *< osculum*, a little mouth, a pretty mouth, a kiss, dim. of *os*, a mouth; see *os2*, *oral*, etc.] I. *trans.* 1. To salute with a kiss; kiss. Imp. Dict. — 2. In *geom.*, to have a higher contact with; touch as closely as possible. Thus, a plane or a circle is said to *osculate* a curve when it has three coincident points in common with the curve — that is, it occupies such a position (and in the case of the circle has such a size) that as it is brought up into this position three points of intersection with the curve run into one. A sphere is said to *osculate* a tortuous curve when it has four coincident points in common with the curve. In these cases, to *osculate* means to have the greatest number of coincident and successive points common to a fixed locus which is compatible with the general character of the locus which osculates; and some geometers restrict the word to this meaning. This meaning is also extended to time: thus, the *osculating* elements of a planet are those elliptic elements which would satisfy three exact observations made at times infinitely little removed from a given epoch. But *osculate* is also used loosely to mean merely that the loci in question have three or more coincident points in common. A tangent line or plane is never said to *osculate* a curve or surface unless it has more than ordinary contact with it.

II. *intrans.* 1. To kiss one another; kiss. Imp. Dict. — 2. In *geom.*, to have, as two loci, three or more coincident and successive points in common. See I., 2. — 3. In *nat. hist.*, to share the characters of another group. Horn. — **Osculating circle**. His antagonist is Set, the deity of evil or darkness, by whom he is slain; but he is avenged by Horus, and reigns in the lower world. With him was formally identified every departed soul in its nether abode, to be protected by him in the necessary conflict with the genius of evil. The worship of Osiris was extended, at about the beginning of the Christian era, over Asia Minor, Greece, and Rome. In art Osiris is usually represented as a mummy, wearing the crown of Upper Egypt, often flanked by ostrich-plumes. They are mostly of small size and metallic colors; the antennæ are simple and similar in both sexes; the maxillary palpi are four-jointed; and the abdomen is globose. It does not occur native, but has been found to constitute a part of the native platinum of all the platinumiferous regions (South America, California, Australia, Russia), in the form of iridosmium, an alloy of the metals osmium and iridium. The specific gravity of the artificially obtained metal has been found to be 22.477; hence it is the heaviest of those bodies. It has never been fused. Its crystalline form is either that of the cube or that of a very obtuse rhombohedron. The crystals are of a bluish-white color, with a violet luster, and are harder than glass. Osmium is not used in the arts, except in the form of iridosmium, of which material the tips of gold pens are made.

**osmose** (os'mōs), *n.* [*< NL. osmosis, < Gr. ὀσμός, impulsion, pushing, < ὀσμι, thrust, push, impel*.] The impulse or tendency of fluids to pass through porous partitions and mix or become diffused through each other; the phenomena attending the passage of fluids, whether liquids or gases, through a porous septum. It is a kind of diffusion (see *diffusion*), and includes *endosmosis* and *exosmosis*—the former being distinguished either as the tendency of the outer fluid to pass through into the inner, or as the action of that fluid which passes with the greater rapidity into the other. When two saline solutions differing in strength and composition are separated by a porous diaphragm or septum of bladder, parchment-paper, or porous earthenware, they mutually pass through and mix with each other; but they pass with unequal rapidities, so that after a time the height of the liquid is not the same on both sides. These phenomena are explained by the unequal molecular attraction exerted between the capillary apertures in the porous diaphragm and the different liquids experimented upon.

**2†.** Capable of being shown; that may be shown; proper or intended to be shown.—**Ostensible partner**, in *law*, a partner whose name is made known, and who appears to the world, as such, as distinguished from a secret or dormant partner; also used in distinction from one so known who is really not such, called a *nominal partner*.—**Syn.** *1.* *Ostensible, Colorable, Specious, Plausible*.

The first three of these words are drawn from that which is addressed to the eye, *plausible* from that which is addressed to the ear. *Ostensible* is, literally, that may be or is held out as true, real, actual, or intended, but may or may not be so; thus, a person's *ostensible* motive for some action is the motive that appears to the observer, and is held out to him as the real motive, which it may or may not be. *Colorable* suggests the possibility of giving the color or aspect of one thing to another, especially of giving the appearance of truth or justice; it has a bad sense, but approaches a good one in the following: "All his [James I. of Scotland's] acquisitions, however fatal to the body of the nobles, had been gained by attacks upon individuals; and, being founded on circumstances peculiar to the persons who suffered, might excite murmurs and apprehensions, but afforded no *colorable* pretext for a general rebellion" (*Robertson*, quoted in *Crabbe*, p. 218). The word is much the least often used of the four. *Specious* is superficially fair, just, or correct, appearing well at first view but easily proved unsound. *Plausible* is applied to that which pleases the ear or the superficial judgment, but will not bear severe examination. *Ostensible* reasons; *colorable* claims; *specious* means; *plausible* explanations.

**ostracism** (os'trā-sizm), *n.* [= F. *ostracisme* = Sp. Pg. It. *ostracismo* = G. *ostracismus*, < NL. *ostracismus*, < Gr. *ostrakismos*, ostracism, < *ostrakon*, ostracize; see *ostracize*.] 1. A political measure employed under restrictions of law among the ancient Athenians, by which citizens whose presence seemed embarrassing to the state were banished by public vote for a term of ten years, with leave to return to the enjoyment of their estates at the end of the period. It has its name from the tablet of earthenware (*ostrakon*) on which every voter wrote the name of the person he desired to ostracize. Ostracism was practised in some other democratic states of Greece, as Argos and Megara, but the method of its administration, except in Athens, remains obscure. Compare *petalism*.

Hence—2. Banishment in general; expulsion; separation; as, social *ostracism* (banishment from good society).

Virtue in courtiers' hearts Suffers an *ostracism* and departs.

Donne, To the Countess of Bedford.

**ostracize** (os'trā-sīz), *v. t.*; pret. and pp. *ostracized*, ppr. *ostracizing*. [*Gr. ostrakizein*, banish by vote, < *ostrakon*, a potsherd or tablet used in voting, a tile, an earthen vessel, the shell of a mussel, oyster, snail, etc., akin to *ostrakon*, an oyster; see *ostrac*.] 1. To exile by ostracism; banish by popular vote, as persons dreaded for their influence or power were banished by the ancient Athenians. See *ostracism*, 1. Hence—2. To banish from society; put under the ban; exclude from public or private favor.

The democratic stars did rise, And all that worth from hence did *ostracize*.

Marvell, Lachrymæ Musarum (1650).

It is a potent support and ally to a brave man standing single, or with a few, for the right, and out-voted and *ostracized*, to know that better men in other parts of the country appreciate the service, and will rightly report him to his own and the next age.

Emerson, Fugitive Slave Law.

Also spelled *ostracise*.

*topoda*. It is characterized by a large, hard and often calcified bivalve shell, or hinged shell-like valves, consist-

ing of two unequal lateral parts of an unsymmetrical carapace, movably joined together and often peculiarly ornamented, a rudimentary abdomen, a very small shell gland; the body not ringed, ending in a bifid tail, very few thoracic appendages (generally two or three) not foliaceous, but cylindrical, like the legs of higher crustaceans; branchiae attached to the thoracic appendages, eyes, when present, median and coalesced or lateral and separate; and antennules and antennae large and subserving locomotion. The *Ostracopoda* are mostly minute fresh-water crustaceans, swimming very actively by means of their antennae; some carry their eggs about with them like ordinary *Cladocera*, but most attach them to foreign substances, as aquatic plants. These crustaceans are common in all geologic strata from the earlier Paleozoic formations, and appear to have undergone little modification. There are several families and a number of genera, such as *Capriis* and *Cytherea*. Also called *Ostracoda* and *Ostrapoda*. See cuts under *Cypris* and *Cytherea*.

The typical and leading genus of the oyster family, *Ostreidae*, having the shell inequilateral and inequivalve, with one valve flatter than the other. There are upward of 200 species, besides many natural and artificial varieties. The genus extends back to the Carboniferous, and there are more species extinct than extant. The common edible oyster of Europe is *O. edulis*; that of the Atlantic coast of the United States is *O. virginica*. See also cuts under *Edulis* and *virginica*.

**ostreaceous** (os-trē-ā'shūs), *a.* [*NL.* *ostreaceus*, < *L.* *ostrea*, an oyster; see *Ostrea*.] Same as *ostracean*.

This distinction of two interior vehicles or tunics of the soul, besides that outer vestment of the terrestrial body (styled in Plato *psychic*), the crustaceans of *ostreaceous* body, is not a mere figment of the latter Platonists since Christianity, but a tradition derived down from antiquity. *Cudworth*, Intellectual System, p. 700.

**Ostreidae** (os-trē-i-dē), *n. pl.* [*NL.* < *Ostrea* + *-idae*.] A family of monomyarian bivalve mollusks, the oysters, typified by the genus *Ostrea*, to which various limits have been assigned. (a) In Woodward's and older systems, a large group including all forms with the mantle quite open, a very small

foot or none, an inequivalve shell, free or adherent to foreign bodies, resting on one valve, with central beaks, internal ligament, single adductor muscle and obscure pallial line. Thus it included not only the *Ostreidae* proper, but also *Anomia*, *Placynidae*, *Pectinidae*, *Lamidae*, and *Spangulidae*. (b) Now restricted to oysters which have the mantle margin double and finely fringed, nearly equal gills united to one another behind, and the mantle lobes forming a complete branchial chamber. The shell is irregular, being both inequivalve and inequilateral, attached by the left valve, and the ligament-cavity is triangular or elongated. In structure the shell is submacronous, and laminated with prismatic cellular substance. Thus limited, the *Ostreidae* contain only the oysters and closely related bivalves, of which there are many species, extinct and extant. Pearl-oysters belong to a different though related family, *Arctiidae*.

**ostreiform** (os'trē-i-fōrm), *a.* [*L.* *ostrea*, an oyster, + *forma*, form.] Oyster-like; resembling an oyster in form; ostraceous.

From the *LL.* *struthio* are also *AS.* *strūta* = *OHG.* *strūz*, *G.* *strausz*; also, after *MHG.* *MLG.* *strūs* = *D.* *struis* = *Sw.* *struts* = *Dan.* *struds*; also *It.* *struzzo*, dim. *struzzolo*, = *OF.* *stracium* (> *ML.* *reflex stracium(n)*) and *ME.* *stracoun*, ostrich.] A very large ratite bird of the genus *Struthio*. The true or African ostrich (*S. camel-*
